IMPORTANT SAFETY NOTICE

Proper service and repair is important to the safe, reliable operation of all Philips Consumer Electronics Company** Equipment. The service procedures recommended by Philips and described in this service manual are effective methods of performing service operations. Some of these service operations require the use of tools specially designed for the purpose. The special tools should be used when and as recommended.

It is important to note that this manual contains various **CAUTIONS** and **NOTICES** which should be carefully read in order to minimize the risk of personal injury to service personnel. The possibility exists that improper service methods may damage the equipment. It also is important to understand that these **CAUTIONS** and **NOTICES ARE NOT EXHAUSTIVE**. Philips could not possibly know, evaluate and advise the service trade of all conceivable ways in which service might be done, or of the possible hazardous consequences of each way. Consequently, Philips has not undertaken any such broad evaluation. Accordingly, a servicer who uses a service procedure or tool which is not recommended by Philips must first satisfy himself thoroughly that neither his safety nor the safe operation of the equipment will be jeopardized by the service method selected.

** Hereafter throughout this manual, Philips Consumer Electronics Company will be referred to as Philips.

WARNING

Critical components having special safety characteristics are identified with a ⚠ or "S" by the Ref. No. in the parts list and enclosed within a broken line* (where several critical components are grouped in one area) along with the safety symbol ⚠ on the schematics or exploded views. Use of substitute replacement parts which do not have the same specified safety characteristics may create shock, fire, or other hazards. Under no circumstances should the original design be modified or altered without written permission from Philips. Philips assumes no liability, express or implied, arising out of any unauthorized modification of design. Servicer assumes all liability.

FIRE AND SHOCK HAZARD

1. Be sure all components are positioned in such a way as to avoid the possibility of adjacent component shorts. This is especially important on those chassis which are transported to and from the service shop.

2. Never release a repaired unit unless all protective devices such as insulators, barriers, covers, strain reliefs, and other hardware have been installed in accordance with the original design.

3. Soldering and wiring must be inspected to locate possible cold solder joints, solder splashes, sharp solder points, frayed leads, pinched leads, or damaged insulation (including the ac cord). Be certain to remove loose solder balls and all other loose foreign particles.

4. Check across-the-line components and other components for physical evidence of damage or deterioration and replace if necessary. Follow original layout, lead length, and dress.

5. No lead or component should touch a receiving tube or a resistor rated at 1 watt or more. Lead tension around protruding metal surfaces or edges must be avoided.

6. Critical components having special safety characteristics are identified with an **'S'** by the Ref. No. in the parts list and enclosed within a broken line* (where several critical components are grouped in one area) along with the safety symbol ⚠ on the schematic diagrams and /or exploded views.

7. When servicing any unit, always use a separate isolation transformer for the chassis. Failure to use a separate isolation transformer may expose you to possible shock hazard, and may cause damage to servicing instruments.

8. Many electronic products use a polarized ac line cord (one wide pin on the plug). Defeating this safety feature may create a potential hazard to the servicer and the user. Extension cords which do not incorporate the polarizing feature should never be used.

9. After reassembly of the unit, always perform an ac leakage test or resistance test from the line cord to all exposed metal parts of the cabinet. Also, check all metal control shafts (with knobs removed), antenna terminals, handles, screws, etc., to be sure the unit may be safely operated without danger of electrical shock.

*** Broken line ____ _ ____ _ ____ _ ____**

LEAKAGE CURRENT COLD CHECK

1. Unplug the ac line cord and connect a jumper between the two prongs of the plug.

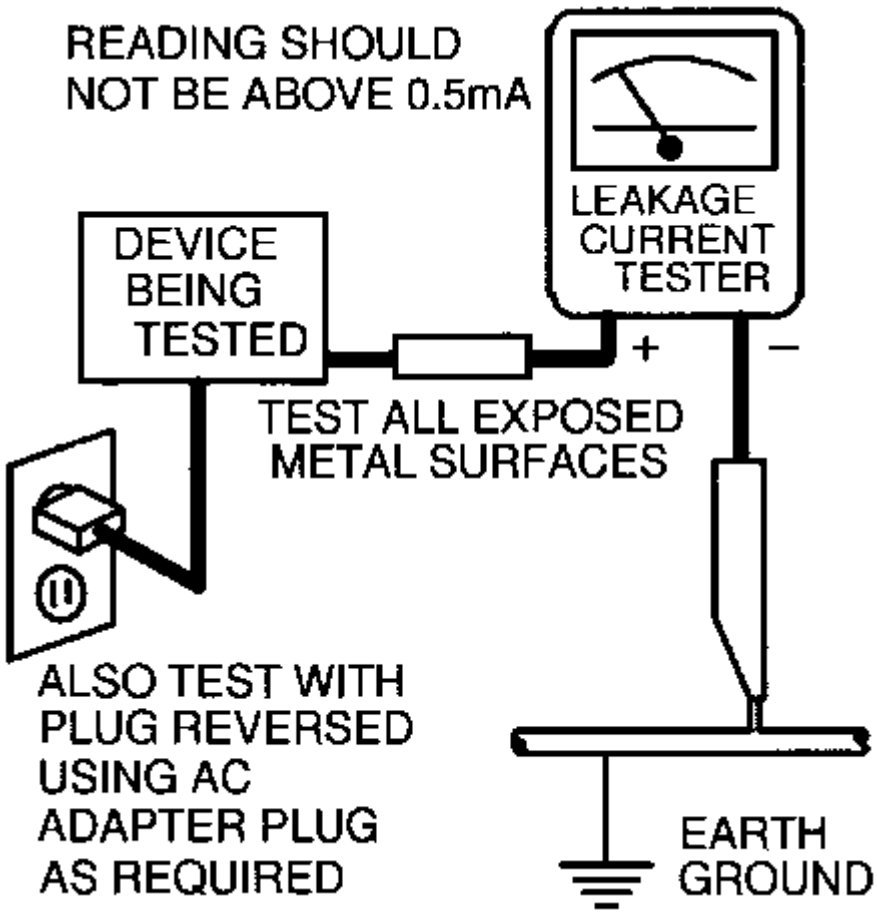
2. Turn on the power switch.

3. Measure the resistance value between the jumpered ac plug and all exposed cabinet parts of the receiver, such as screw heads, antennas, and control shafts. When the exposed metallic part has a return path to the chassis, the reading should be between 1 megohm and 5.2 megohms. When the exposed metal does not have a return path to the chassis, the reading must be infinity. Remove the jumper from the ac line cord.

LEAKAGE CURRENT HOT CHECK

1. Do not use an isolation transformer for this test. Plug the completely reassembled receiver directly into the ac outlet.

2. Connect a 1.5k, 10W resistor paralleled by a 0.15uF. capacitor between each exposed metallic cabinet part and a good earth ground such as a water pipe, as shown below.



3. Use an ac voltmeter with at least 5000 ohms/volt sensitivity to measure the potential across the resistor.

4. The potential at any point should not exceed 0.75 volts. A leakage current tester may be used to make this test; leakage current must not exceed 0.5mA. If a measurement is outside of the specified limits, there is a possibility of shock hazard. The receiver should be repaired and rechecked before returning it to the customer.

5. Repeat the above procedure with the ac plug reversed. (Note: An ac adapter is necessary when a polarized plug is used. Do not defeat the polarizing feature of the plug.)

OR

With the instrument completely reassembled, plug the ac line cord directly into a 120Vac outlet. (Do not use an isolation transformer during this test.) Use a leakage current tester or a metering system that complies with American National Standards Institute (ANSI) C101.1 Leakage Current for Appliances and Underwriters Laboratories (UL) 1410, (50.7). With the instrument ac switch first in the on position and then in the off position, measure from a known earth ground (metal water pipe, conduit, etc.) to all exposed metal parts of the instrument (antennas, handle brackets, metal cabinet, screw heads, metallic overlays, control shafts, etc.), especially any exposed metal parts that offer an electrical return path to the chassis. Any current measured must not exceed 0.5mA. Reverse the instrument power cord plug in the outlet and repeat the test. See the graphic below.

TV SAFETY NOTES

SAFETY CHECKS

After the original service problem has been corrected, a complete safety check should be made. Be sure to check over the entire set, not just the areas where you have worked. Some previous servicer may have left an unsafe condition, which could be unknowingly passed on to your customer. Be sure to check all of the following:

Fire and Shock Hazard
Implosion
X-Radiation
Leakage Current Cold Check
Leakage Current Hot Check
Picture Tube Replacement
Parts Replacement

WARNING: Before removing the CRT anode cap, turn the unit OFF and short the HIGH VOLTAGE to the CRT DAG ground.

SERVICE NOTE: The CRT DAG is not at chassis ground.

IMPLOSION

1. All picture tubes used in current model receivers are equipped with an integral implosion system. Care should always be used, and safety glasses worn, whenever handling any picture tube. Avoid scratching or otherwise damaging the picture tube during installation.

2. Use only replacement tubes specified by the manufacturer.

X-RADIATION

1. Be sure procedures and instructions to all your service personnel cover the subject of X-radiation. Potential sources of X-rays in TV receivers are the picture tube and the high voltage circuits. The basic precaution which must be exercised is to keep the high voltage at the factory recommended level.

2. To avoid possible exposure to X-radiation and electrical shock, only the manufacturer's specified anode connectors must be used.

3. It is essential that the service technician has an accurate HV meter available at all times. The calibration of this meter should be checked periodically against a reference standard.

4. When the HV circuitry is operating properly there is no possibility of an X-radiation problem. High voltage should always be kept at the manufacturer's rated value - no higher - for optimum performance. Every time a color set is serviced, the brightness should be run up and down while monitoring the HV with a meter to be certain that the HV is regulated correctly and does not exceed the specified value. We suggest that you and your technicians review test procedures so that HV and HV regulation are always checked as a standard servicing procedure, and the reason for this prudent routine is clearly understood by everyone. It is important to use an accurate and reliable HV meter. It is recommended that the HV reading be recorded on each customer's invoice, which will demonstrate a proper concern for the customer's safety.

5. When troubleshooting and making test measurements in a receiver with a problem of excessive high voltage, reduce the line voltage by means of a Variac to bring the HV into acceptable limits while troubleshooting. Do not operate the chassis longer than necessary to locate the cause of the excessive HV.

6. New picture tubes are specifically designed to withstand higher operating voltages without creating undesirable X-radiation. It is strongly recommended that any shop test fixture which is to be used with the new higher voltage chassis be equipped with one of the new type tubes designed for this service. Addition of a permanently connected HV meter to the shop test fixture is advisable. The CRT types used in these new sets should never be replaced with any other types, as this may result in excessive X-radiation.

7. It is essential to use the specified picture tube to avoid a possible X-radiation problem.

8. Most TV receivers contain some type of emergency "Hold Down" circuit to prevent HV from rising to excessive levels in the presence of a failure mode. These various circuits should be understood by all technicians servicing them, especially since many hold down circuits are inoperative as long as the receiver performs normally.

PICTURE TUBE REPLACEMENT

The primary source of X-radiation in this television receiver is the picture tube. The picture tube utilized in this chassis is specially constructed to limit X-radiation emissions. For continued X-radiation protection, the replacement tube must be the same type as the original, including suffix letter, or a Philips approved type.

PARTS REPLACEMENT

Many electrical and mechanical parts in Philips television sets have special safety related characteristics. These characteristics are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. The use of a substitute part which does not have the same safety characteristics as the Philips recommended replacement part shown in this service manual may create shock, fire, or other hazards.

PRODUCT SAFETY GUIDELINES FOR ALL PRODUCTS

CAUTION: Do not modify any circuit. Service work should be performed only after you are thoroughly familiar with all of the following safety checks. Risk of potential hazards and injury to the user increases if safety checks are not adhered to.

USE A SEPARATE ISOLATION TRANSFORMER FOR THIS UNIT WHEN SERVICING.

PREVENTION OF ELECTROSTATIC DISCHARGE (ESD)

Some semiconductor solid state devices can be damaged easily by static electricity. Such components commonly are called Electrostatically Sensitive (ES) Devices, Examples of typical ES devices are integrated circuits and some field-effect transistors and semiconductor "chip" components. The following techniques should be used to help reduce the incidence of component damage caused by electrostatic discharge (ESD).

1. Immediately before handling any semiconductor component or semiconductor-equipped assembly, drain off any ESD on your body by touching a known earth ground. Alternatively, obtain and wear a commercially available discharging ESD wrist strap, which should be removed for potential shock reasons prior to applying power to the unit under test.

2. After removing an electrical assembly equipped with ES devices, place the assembly on a conductive surface such as aluminum foil, to prevent electrostatic charge buildup or exposure of the assembly.

3. Use only a grounded-tip soldering iron to solder or unsolder ES devices.

4. Use only an anti-static solder removal device. Some solder removal devices not classified as "antistatic (ESD protected)" can generate an electrical charge sufficient to damage ES devices.

5. Do not use Freon propelled chemicals. These can generate electrical charges sufficient to damage ES devices.

6. Do not remove a replacement ES device from its protective package until immediately before you are ready to install it (most replacement ES devices are packaged with leads electrically shorted together by conductive foam, aluminum foil or comparable conductive material).

7. Immediately before removing the protective material from the leads of a replacement ES device, touch the protective material to the chassis or circuit assembly into which the device will be installed.

CAUTION: Be sure no power is applied to the chassis or circuit and observe all other safety precautions.

8. Minimize bodily motions when handling unpackaged replacement ES devices. (Otherwise harmless motion such as the brushing together of your clothes fabric or the lifting of your feet from a carpeted floor can generate static electricity (ESD) sufficient to damage an ES device.)

NOTE to CATV system Installer:
This reminder is provided to call the CATV system installer's attention to article 820-22 of the NEC that provides guidelines for proper grounding and, in particular, specifies that the cable ground shall be connected to the grounding system of the building, as close to the point of cable entry as practical.

PRACTICAL SERVICE PRECAUTIONS

IT MAKES SENSE TO AVOID EXPOSURE TO ELECTRICAL SHOCK. While some sources are expected to have a possible dangerous impact, others of quite high potential are of limited current and are sometimes held in less regard.

ALWAYS RESPECT VOLTAGES. While some may not be dangerous in themselves, they can cause unexpected reactions – reactions that are best avoided. Before reaching into the powered color TV set, it is best to test the high voltage insulation. It is easy to do, and is just a good service precaution.

BEFORE POWERING UP THE TV WITH THE BACK OFF (or on a test fixture), attach a clip lead to the CRT DAG ground and to a screwdriver blade that has a well insulated handle. After the TV is powered on and high voltage has developed, probe the anode lead with the blade, starting at the bottom of the High Voltage Transformer (flyback – IFT). Move the blade to within two inches of the connector of the CRT. **IF THERE IS AN ARC, YOU FOUND IT THE EASY WAY, WITHOUT GETTING A SHOCK!** If there is an arc to the screwdriver blade, replace the High Voltage Transformer or the lead, (if removable) whichever is causing the problem.

PICTURE TUBE REPLACEMENT PROCEDURE

Note: a. Two (2) people are required to handle this picture tube.
b. Safety Glasses must be worn during this procedure or whenever directly handling a picture tube.
c. Take care in each step not to damage the CRT or the cabinet.

1. Remove the Chassis and the CRT Socket Board Module from the cabinet.
2. A furniture pad or blanket should be positioned on the floor to support only the CRT Face. This pad or blanket should be high enough to keep the CRT Face approximately 12 to 14 inches off the floor.
3. Using two people, place the cabinet in a front down position with the CRT Face on the pad or blanket.
4. Place padded blocks under each corner of the cabinet to keep it from rocking.
5. Remove the four screws, at the corners of the CRT.
6. With two people lowering the cabinet to the floor, leave the CRT elevated by the pad or blanket.

Note: Take care not to grasp the neck of the CRT during this procedure, as it is extremely fragile.

7. Two (2) people may then lift the CRT from the cabinet.
8. Remove the degaussing coil from the defective CRT and mount on the replacement. Take care to maintain the exact shape and fit.

To install the new CRT, reverse steps 1 to 7.

GENERAL INFORMATION

The following Product highlights while specific to the 43PP92 model, are typical of the features found on many of the HDR2002, DPT300 Series Models.

Product highlights

Multipoint digital convergence
Designed to meet the demands of curved CRT faceplates and short focal length lenses, our expansive 35-point convergence brings with it the accuracy of digital technology for flawless convergence of red, green, and blue guns and a superb picture with no colored haloes.

Automatic Phosphor Aging Compensation — APAC
Non-moving images can be bad for a television screen. If a video image remains stationary, it can eventually leave a permanent after-image on the screen. Video games and the stationary black bars which outline standard 4:3 programming on a widescreen TV compound this problem. Now, Philips has found a way to combat this problem through APAC technology. Periodically, APAC automatically shifts your television picture in very small increments, but increments large enough to blur image retention.

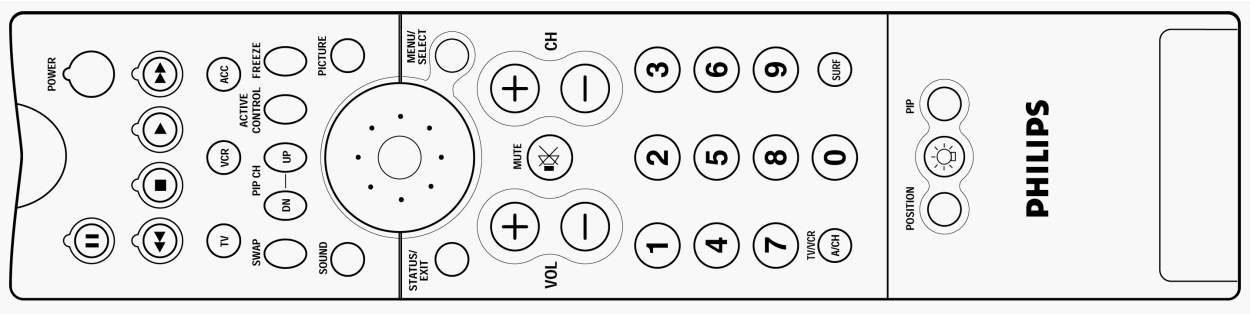
Coupled with the Philips Auto Format feature, you have excellent protection from the dreaded screen burn. Think of it as a screen saver for your TV.

Active Control™
Continuous picture analysis and control of Automatic Digital Noise Reduction and Auto Sharpness. Automatically offers the best picture settings. The demo menu shows real-time adjustments of two parameters based on picture content.

Eye Fidelity — Progressive Scan/Interlaced
Eye Fidelity gives the consumer a choice between two different scanning techniques — Progressive Scan and Interlaced. Progressive Scan doubles the number of visible picture lines per field by displaying all picture frame lines at once — also eliminating line flicker. The Interlaced mode provides for a double vertical display (interlaced) of Progressive Scan, which reduces annoying motion artifacts. The Interlaced mode also helps smooth out jagged lines sometimes seen on curved and angled surfaces.

Protective screen filter
This filter has been specifically formulated by Philips for HD displays to give the best possible picture and still protect your investment. The protective screen filter helps prevent accidental damage to the delicate front Lenticular screen.

High definition component
Supports HD video input for superb color purity, crisp color detail, and reduced color noise - Includes separate inputs for Y, Pb, Pr, horizontal sync and vertical sync.



3 line digital comb filter
Improved chroma/luminance separation over standard two-line glass comb filters for a difference you can really see. Offering vertical edge enhancement and virtually no "dot crawl," it easily supports the demands of DVD video players, Web browsers, and other advanced, high resolution video media programming
information for all television program listings, plot (through A/V inputs).

Picture-In-Picture
Used in conjunction with a second video source such as a DVD, VCR, or cable tuner, picture-in-picture allows you to monitor one TV channel while watching another; monitor a DVD or tape playback while watching another program, or monitor a TV channel while viewing an external source. Plus the main and secondary pictures may be swapped. In all cases, the main picture is provided with its corresponding audio.

Virtual Dolby ® Surround — 20 Watt RMS
Dolby ® processing circuitry for enhanced surround sound effect creates the sensation of Dolby ® Pro Logic without the hassle of additional rear speakers.

Universal remote control - RC2018/1

Universal RC managing TV and peripherals.

Supporting features

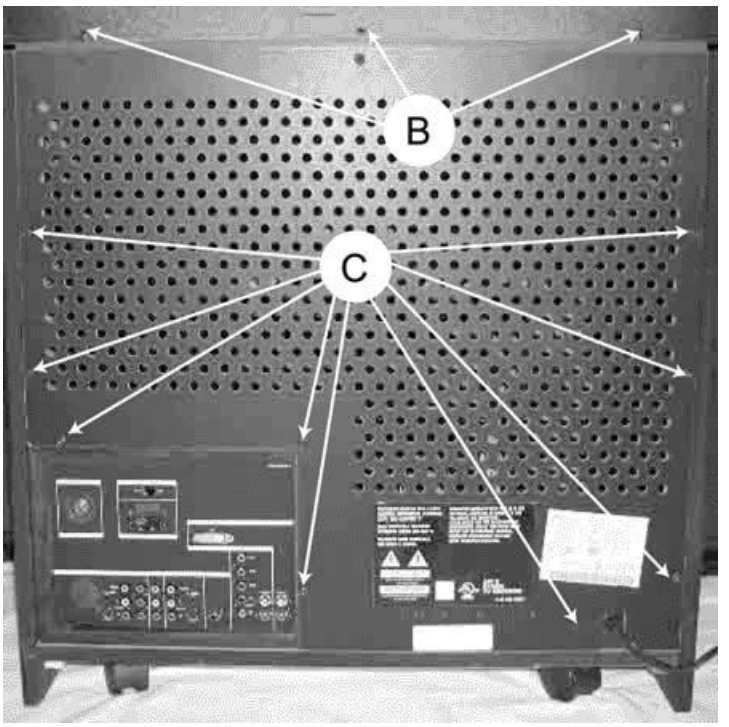
• Digital Color Transient Improvement (CTI)
• Digital Histogram
• Picture Freeze
• Auto Aspect Ratio Adaptation
• Incredible Surround™
• Automatic Volume Leveler (AVL)
• Independent headphone volume control
• EasyTune™ (Auto Search, Auto Tune, Auto Install)
• Alternate Channel
• AutoSurf™
• Low power standby (<1W)

DISASSEMBLY PROCEDURES

Disassembly Procedures (46, 50, 55, & 60 Inch Models)

All numbers found in the following text refer to the CABINET DISASSEMBLY EXPLODED VIEW drawing and apply to 46", 50", 55", and 60" models.

NOTE: If you are servicing a PCB or speaker, you do not have to remove the plastic upper Back cover.



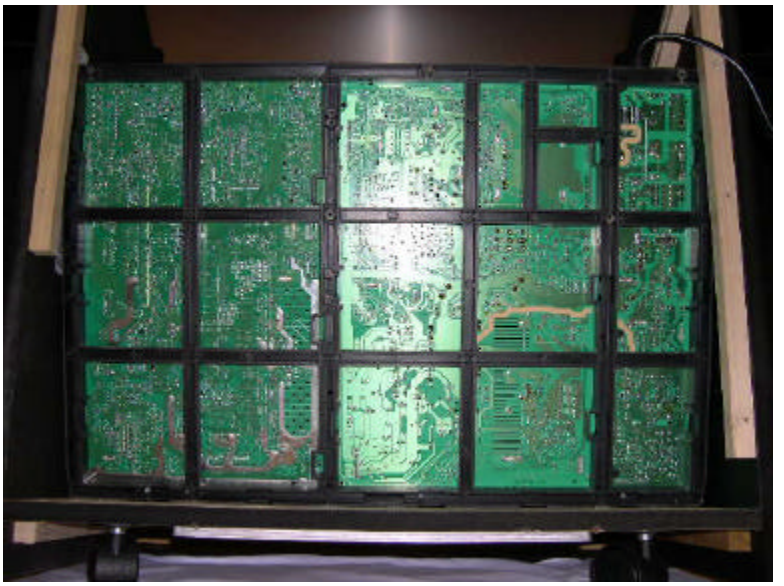
Upper Back Cover (AC02)

1. Remove 12 screws (A).
2. Remove 3 screws (B).
3. Lift cover up to dislodge from pegs (J) and remove cover.

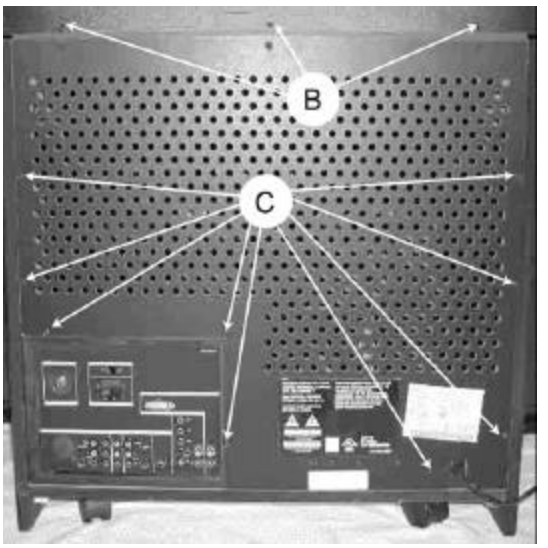
Lower Center Back Cover (AC04)

1. Remove 3 screws (B).
2. Remove 8 screws (C).

Lower Back Cover Removal

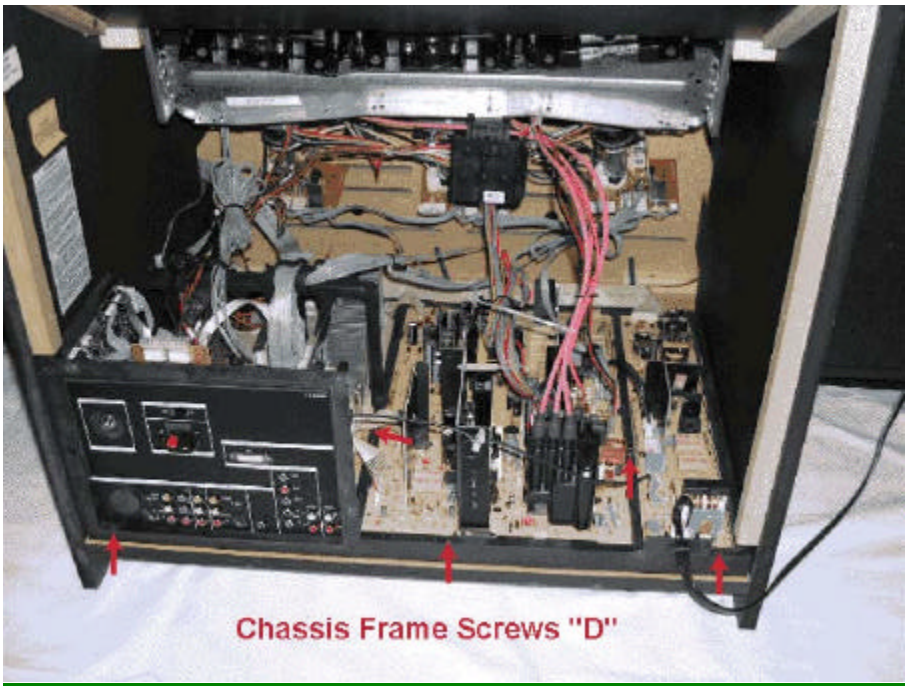


Service Position

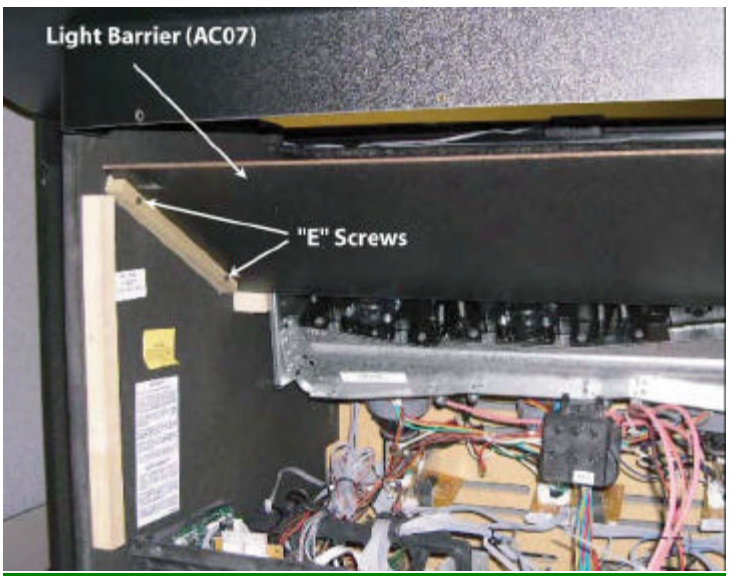


(Note: Unplug the AC Line Cord)

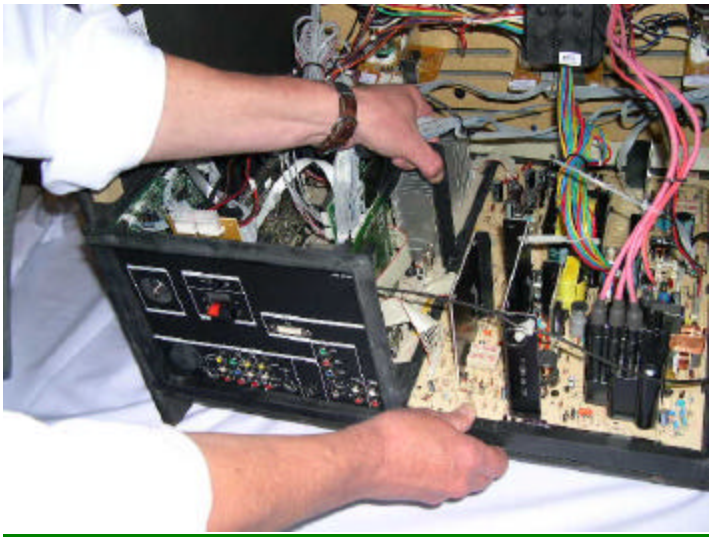
This Service Position exposes the entire bottom side of the Power Supply Panel, Large Signal Panel (LSB), & the Small Signal Panel (SSM). A major portion troubleshooting can be accomplished after completing this procedure.



Display Service Position

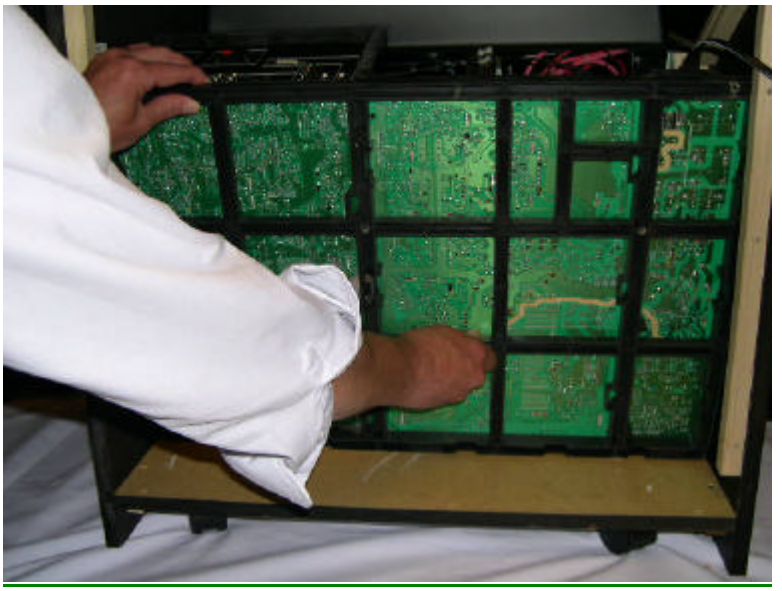


1. Remove Lower Back Cover.
   Remove 12 screws “B & C” required for Lower Back Cover Removal.
   Lower Back Cover Removal.



2. Loosen the Chassis Frame.
   Remove 5 screws “D” that fasten the Chassis Frame to the Cabinet Bottom.
   Service Pos. Detail - A.

3. Remove Light Barrier (AC07)
   Service Detail - B



4. Remove 2 screws “E” from the Left Side - Light Barrier Guide and remove this Guide.
5. Grasp the corners of the Chassis Frame and slide in towards you about a inch.
   This is required in order that 3 metal cleats (AC36) holding the front edge of the Chassis Frame are released.
6. While holding the back edge of the Chassis Frame down, grasp the Panel Mounting Bracket (AC21) and slightly lift the front of the Chassis Frame.
   Service Detail - C

7. With the rear of the Chassis slightly raised, slide the entire Chassis forward (toward the Cabinet Front), just far enough that the Rear Jack Panel (AC08) clears the Left Side Mounting Block (for the Lower Back Cover).
   Service Position Detail - D

8. Now, lift the back edge of the Chassis Frame (nearest you), up while also lifting (slightly), the front edge to slide forward in to the Service Position shown.
   Service Position Detail - E

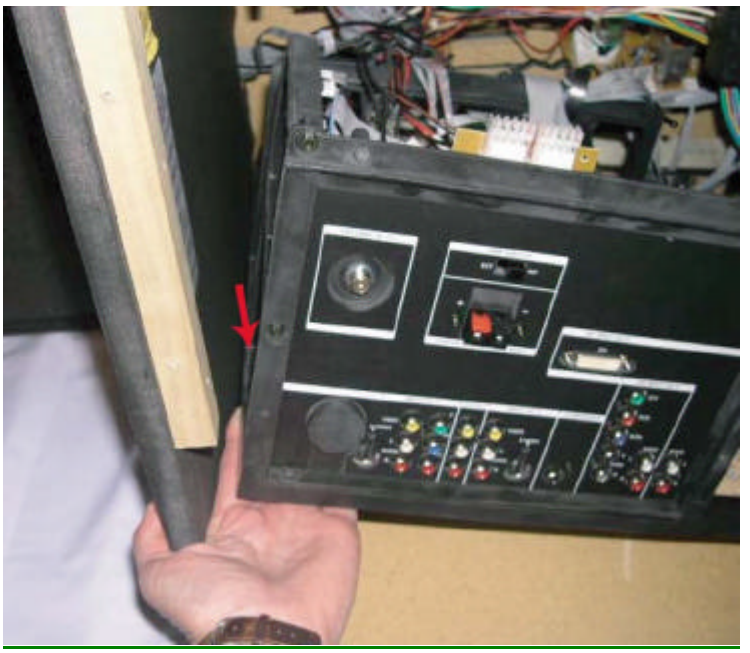
Mirror Mounting Board (AC18)

1. Remove 6 screws located in the mirror mounting board brackets and remove the board.
   Note: Care should be taken **NOT** to place fingerprints or smudges on the mirror.

Side Back Covers

1. Remove 4 screws (F) from each of the Side Back Covers. (Some prying may be necessary to dislodge covers.
   Note: This allows access to the Side Jack Panel and Left and Right Speakers.

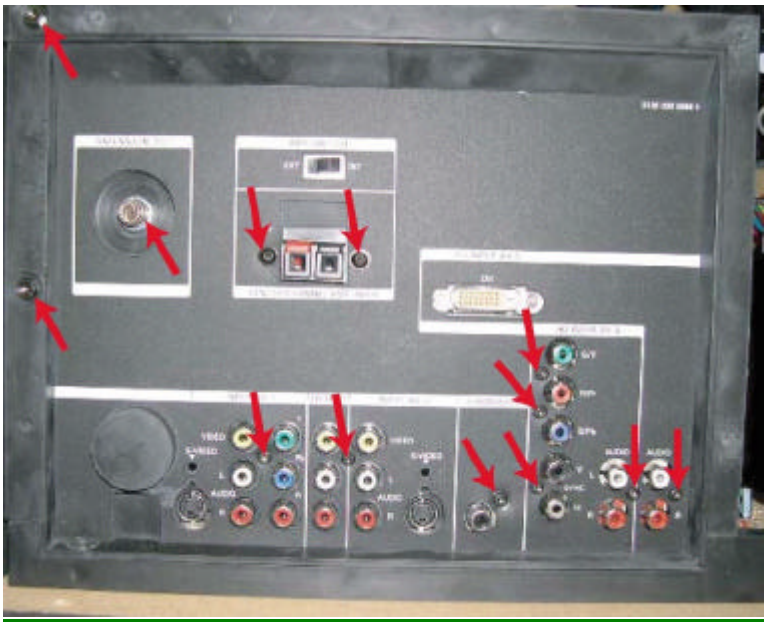
Large Signal Panel



1. Remove 3 screws from center of the CBA and pull 3 tabs on right of bracket.
2. Lift right side of LSP and slide panel up and out.

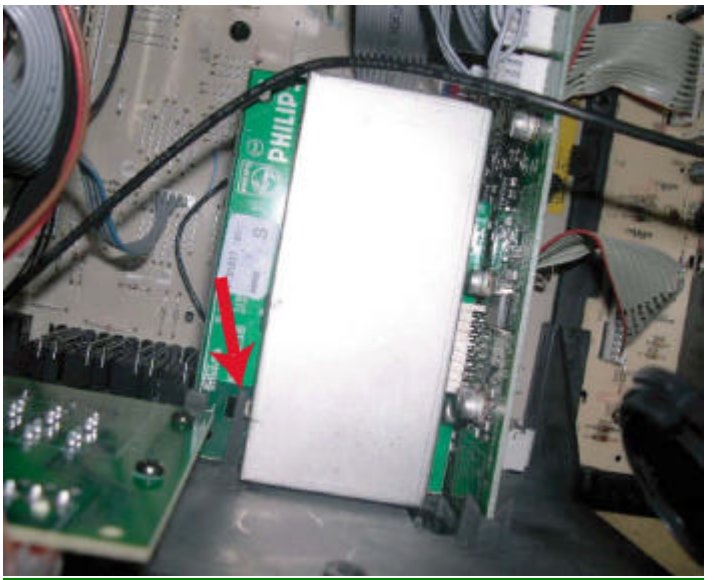
Power Supply Panel

1. Remove 4 screws from CBA.
2. Lift PFC Filter Panel up and out.



Rear Jack Panel Cover (AC08 & AC27)

1. Complete steps 1 through 7 of the Service Position Procedure (see above). Note: Steps 3 & 4 may be omitted as removal of the Light Barrier and its Mounting Guide is not required.
2. With the Chassis loose from the cabinet bottom, and the entire chassis repositioned back towards the Cabinet Front, lift the left end of the Chassis Assembly in order to remove the previously hidden screw shown in the following detail. Note: This screw may be removed using a ¼ " nut driver or a T20 Torx Driver. In either case, an extension may be required in order to achieve the proper angle to the head of the screw.
   Jack Panel Hidden Screw.



3. Remove 2 screws from the left edge and upper left corner of the Rear Jack Panel Cover. These 2 screws may be removed using a ¼ " nut driver or a T20 Torx Driver and be seen in the following display on the left edge and upper left corner.
4. Remove the nut around the 75 Ohm Antenna Input
5. Remove 10 more screws shown in the following using a Torx 10 Driver.

Jack Panel Screw Removals

6. Disconnect 2 Connectors from the top of the Rear Switch Panel. This Panel fastens to the Jack Panel Cover and may easily be removed or reconnected once the Jack Panel Cover is completely free of the Chassis Assembly.
7. Although all screws should now have be removed, care must taken on Core Models featuring the HD Input. The Jack Panel Cover has a plastic hook that clips in to a hole on the DVI Panel. Gently lift this hook while removing the Jack Panel Cover.
   Jack Panel Hook to DVI Module.

Small Signal Panel (SSM)

1. Remove rear Jack Panel cover (AC08).
2. Remove 2 screws from the center of the SSP CBA.
3. Pull 3 tabs on right of panel bracket.
4. Lift right side of SSP, then move to the right to remove.

Side Jack Panel

1. Remove Left Side Back Cover. (See procedure above.)
2. Remove 2 screws from panel.
3. Slide Side Jack Panel CBA out of bracket.

PIP Panel Removal

1. Remove rear Jack Panel cover (AC08).
2. Remove 3 screws from PIP panel.

Small Signal Board (SSB)

1. Remove panel support bracket (AC23).
2. Remove panel support bracket (AC21).
3. Tilt SSB to the right and then up.

Convergence (ACS) Panel Removal

1. Remove panel support bracket (AC21).
2. Release stay tabs on Left side of each board connector and carefully separate ACS from SSP connectors.

Wide Band Video (HOP) Panel

1. Remove panel support bracket (AC21).
2. Disconnect ribbon cable connectors.
3. Release stay tabs on Left side of each board connector and carefully separate from SSP connectors.

Front Control Panel and Left or Right Speaker

1. Remove front speaker baffle (AC30) by removing Left and Right Side Back Covers.
2. Release 2 tabs on either side of the speaker baffle.
3. Loosen ribbon cable and grounding wire to allow working space.
4. Remove 2 screws to remove Front Control panel.
5. Remove 4 screws each to remove speakers.

Plastic Light Barrier (Optical Assembly)

1. Remove 2 screws (E) located at either end of the plastic light barrier.

Complete Optical Assembly or Individual Light Box Assemblies

1. Remove the Plastic Light Barrier.
2. Disconnect the CRT panels, 2nd anode leads (at HVT), and yoke connectors from assemblies to be removed.
3. To remove the complete Optical Assembly, remove 4 screws (G), and lift assembly up and out.
4. To remove individual CRT assemblies, remove 4 screws (H), from the assembly you wish to remove, and lift assembly up and out.
   DO NOT disturb the focus assembly wing nuts.

Disassembly Procedures (43 Inch)

All numbers found in the following text refer to the CABINET DISASSEMBLY EXPLODED VIEW drawing for 43" models.

NOTE: If you are servicing a PCB or speaker, you do not have to remove the plastic upper Back cover.

Lower Back Cover (AC04)

1. Remove 8 screws (A).
2. Remove 4 screws (B).

Upper Back Cover (AC02)

Note: The upper back is a part of the MAIN unit and holds the Mirror.
Removal is only necessary for optical assembly maintenance.

1. Remove 9 screws (C).
2. Perform Lens frame removal procedure.
3. Remove 10 screws (D).

Speaker Baffle (AC30) and Speakers (AC25)

1. Perform Lower Back cover removal procedure. (AC04)
2. Remove 4 screws (E)
3. Carefully pull on Baffle to release guide tabs.
   (Note: Unit may have to be tilted backward to remove Baffle.)
4. Remove 4 screws each to remove speakers. (AC25)

Lens Frame Assembly (AC09) and Convergence Sensors

1. Perform Lower Back cover removal procedure. (AC04)
2. Perform Speaker Baffle removal procedure. (AC30)
3. Remove 9 screws (C). (Upper Back)
4. Remove 4 screws (F).
5. Tilt frame forward from top and disconnect cables to Side Jack Panel and Front Control Panel.
   NOTE: Before performing the next procedure, note the proper location of each of the 4 Convergence Sensors. **(Not in all models.)**
6. Snap out the 4 Convergence Sensors and slip connecting wires through slits in the Lens mounting rails.
   Note: Be sure to note proper wire routing for later replacement. Wires CANNOT be left so as to obstruct the mirror reflection.

Front Control Panel

1. Perform Lens Frame removal procedure.
2. Remove 2 screws (G).

Side Jack Panel

1. Perform Lens Frame removal procedure.
2. Remove 2 screws (H)
3. Slide Side Jack Panel CBA out of bracket.

Mirror (AC18) Removal

1. Perform Lens Frame removal procedure.
2. Remove 4 screws located in the mirror mounting brackets and remove the mirror.
   Note: Care should be taken **NOT** to place fingerprints or smudges on the mirror.

Large Signal Panel (LSB)

1. Remove 3 screws from center of the CBA and pull 3 tabs on right of bracket.
2. Lift right side of LSP and slide board up and out.

Power Supply Panel

1. Remove 4 screws from CBA.
2. Lift PFC Filter Panel up and out.

Small Signal Panel (SSM)

1. Remove 2 screws from the center of the CBA.
2. Pull 3 tabs on right of bracket.
3. Lift right side of Small Signal Board up, then to the right to remove.

PIP Panel Removal

1. Remove 3 screws from panel.

Removal of SSB Panel

1. Remove panel support clip (AC04).
2. Tilt top of SSB to the right and then up.

Complete Optical Assembly or Individual Light Box Assemblies

1. Perform Lower Back Cover removal procedure.
2. Perform Speaker Baffle removal procedure.
3. Perform Lens Frame removal procedure.
4. Perform Upper Back Cover removal procedure.
5. Disconnect the CRT Panels, 2nd anode leads (at HVT), and yoke connectors from all CRT assemblies.
6. Remove 4 screws located at front of Optical assembly and lift assembly up and out.
7. To remove individual CRT assemblies, loosen 4 screws located in the assembly you wish to remove and lift assembly up and out.

Service Position

(Note: Side Jack and Front Control Panels may have to be removed to allow cable slack.)

1. Perform Back Cover removal procedure.
2. Remove 7 screws (I).
3. Pull Chassis Frame back and up.
4. Tilt Chassis Frame upward on bottom of PTV.

Picture Tube Replacement

Refer to CRT Assembly Exploded View

Replacement of the cathode ray tube (CRT) and/or optical system components of a Projection TV (PTV) can be easily accomplished by following general guidelines. Use care when working around the CRT and optical systems of the PTV. The PTV light path encompasses a number of precision optical components. These include lenses, mirrors, the lenticular screen, and fresnel lens. The PTV incorporates three separate CRTs, representing green, red, and blue outputs. Each CRT uses an independent deflection/convergence yoke, magnetic centering ring, coupler, C-element lens, and output lens (A/B lens). Each tube is mechanically fastened to a coupler which houses fluid (a glycol-type substance) used to cool the high temperatures generated by the small (7") CRTs. The fluid also provides an optical characteristic supporting the optical system of the PTV. When replacement of a CRT or optical component is required, caution must be exercised in preventing fluid spillage. The technician must carefully reassemble the CRT/optical components, ensuring a proper seal of the coupling fluid. Use only factory original coupling fluid.
Caution: Do not use or add water as an alternative to the prescribed coupling fluid.
The following procedure should be used when performing repairs on the CRT/optical assemblies of the Projection TV.
Note: Upon completion of CRT/optical assembly repair, the centering, convergence, gray scale, mechanical and electrical focus adjustments are required. If more than one assembly requires repair, it is recommended the service technician fully complete one assembly at a time, using the existing assemblies as a reference for the alignment of the centering and convergence.

A. Single CRT/Lens Assembly from the Light Rack

1a) Remove AC power from the PTV.
2a) Remove the upper and lower back covers (1/4" screws).
3a) Remove the barrier board and the shield cover from around the lens assemblies (1/4" screws).
4a) Carefully remove the CRT Socket Board from the CRT of the CRT/optical assembly being serviced.
5a) Remove the yoke and convergence plugs, of the CRT/optical assembly being serviced, from the Large Signal Module.
6a) Remove the high voltage anode lead from the HV splitter block on the Large Signal Module of the CRT/optical assembly being serviced. Remove ground lug connectors from the coupler frame.
7a) Remove the four 1/4" screws that secure the CRT/lens assembly to the light rack. These four screws are located in each corner, on the top of the coupler assembly.

Caution: Do not remove the bolts with pressure springs or the inverted Torx screws of the CRT/lens assembly. The removal of these components could result in fluid spillage into the PTV cabinet.

8a) Carefully remove the CRT/lens assembly from the PTV cabinet.

Servicing the CRT/Optical Assembly

Caution: Do not attempt any repairs on the CRT/optical block assembly without first removing the CRT coupling fluid. Removal of the delta output lens will result in spillage of the coupling fluid.
Caution: Coupling fluid is a poisonous solution containing a high concentration of ethylene glycol. Do not leave exposed fluid unattended. Prevent children or pets from coming into contact with the fluid. Clean up spills immediately.

B. Removing the PTV Coupling Fluid

All repairs made to the CRT/optical block assembly require the removal of the coupling fluid. The following procedure describes how to remove the PTV coupling fluid.

1b) Lay the CRT assembly on its side with the plug pointing up.
2b) Remove the plug (X8).
3b) Remove some of the fluid from the coupler to prevent spillage when the CRT is removed. An empty coupling fluid bottle with a cone top is recommended to lower the fluid level within the coupler. Squeeze and hold the bottle and insert the tip of the cap into the drain hole of the coupler. Loosen the grip on the bottle, allowing the fluid to be pulled up into the bottle. Save the fluid.
4b) Reinstall the plug (X8).
5b) Stand the CRT assembly up with the neck of the CRT pointing up.
6b) With an awl or marking pen, outline the edges of the CRT onto the coupler.

Note: The correct positioning of the CRT to the coupler is critical to the optimum performance of the optical system.

7b) Remove the four CRT mounting bolts (A) (with springs and spacers) and remove the mounting bracket (D).
8b) Remove the four CRT mounting ear screws.

Note: The CRT mounting ear screws are not used on some assemblies.

9b) Gently remove any metal shavings from around the screw holes. Do not allow the metal shavings to get into the fluid.
10b) Note the position of the high voltage anode cap with respect to the coupler.
11b) Carefully remove the CRT from the coupler. Wipe any excess fluid from the faceplate of the CRT. Set the CRT aside.
12b) Use an empty coupling fluid bottle to extract the remainder of the fluid from the coupler.

Note: Complete removal of the coupling fluid is not necessary when only replacing the CRT.

13b) Clean any remaining fluid from the coupler and the CRT gasket channel using absorbent tissue. Refer to "C". Cleaning the Coupler, C-element Lens and CRT Faceplate procedure if the fluid is discolored or contaminated.
14b) Make all necessary repairs.

C. Cleaning the Coupler, C-element Lens and CRT Faceplate

1c) Remove CRT coupling fluid as described in steps 1b through 13b.
2c) Using denatured alcohol on a cloth made of 100% cotton or a lens cleaning tissue, gently clean the C-element (fisheye) lens, coupler and the CRT faceplate. Thoroughly clean the coupler assembly, including the expansion chamber bladder, and allow to fully dry.

Caution: Do not use soap or detergent type substances to clean the coupler and its related assemblies. Water can be used as an alternative to denatured alcohol, but the assemblies must be completely dry prior to reassembly of the coupler and the addition of the coupling fluid. A hair dryer may be used to dry the coupler and its assemblies prior to reassembly. If contaminated fluid is discovered, the coupler and its related assemblies must be completely disassembled and cleaned to prevent a reoccurrence.

3c) Replace the CRT and C-element lens gaskets.
4c) Reassemble the C-element lens and the output lens to the coupler.
5c) Refer to "Replacing the CRT Coupling Fluid" upon completion of necessary repairs and cleaning of the optical/coupler assemblies.

D. Replacement of the CRT

1d) Remove CRT coupling fluid as described in steps 1b through 13b.
2d) Remove the plastic protective coating (if present) from the faceplate of the replacement CRT.
3d) Refer to "Replacing the CRT Coupling Fluid" to complete the CRT replacement.

E. Repair or Replacement of the Optical/Coupler Assembly

1e) Remove CRT coupling fluid as described in steps 1b through 13b.
2e) Remove the four inverted-type Torx screws which secure the Delta output lens to the coupler. An inverted-type Torx socket can be purchased using part number 483539517303.
3e) Removal of the Delta output lens will allow access to the C-element lens, C-element gasket, coupler, and its assemblies.
4e) Refer to "Replacing the CRT Coupling Fluid" upon completion of necessary repairs to the optical/coupler assemblies.

F. Replacing the PTV Coupling Fluid

Note: Prior to replacing the CRT coupling fluid, ensure the expansion chamber bladder is fully collapsed. This can be easily inspected by viewing the bladder through the small hole on the expansion chamber assembly. If the rubber of the bladder is not easily visible through the small hole, then the bladder may be considered collapsed and fluid can be added. If the rubber of the expansion chamber bladder is visible at the hole of the expansion chamber, then replacement of the expansion chamber bladder is required.

Note: The CRT coupling fluid is critical to the optical performance of the PTV. Use only part number 483531057233 (3 bottle kit) or 483531067004 (1 bottle) to ensure the optical integrity and performance reliability of the PTV when replacing the CRT coupling fluid.

1f) Reinstall the CRT gasket into the gasket channel of the coupler. Confirm the placement of the CRT, C-element lens, and vent plug gaskets.
2f) Place the CRT onto the coupler with the high voltage anode lead positioned as marked in step 10b of procedure B.
3f) Carefully position the CRT onto the coupler, using the outline defined in step 6b of procedure B as a reference.
4f) Start the CRT mounting ear screws but do not tighten them.
5f) Tighten the CRT mounting ear screws in a star pattern (like tightening lug nuts on the wheel of a car). Make sure the CRT does not shift position from the outline defined in step 6b.

Caution: Do not over tighten the CRT ear screws.

Note: The CRT mounting ear screws are not used on some assemblies.

6f) Install the CRT mounting bracket and start the four CRT mounting bracket bolts with springs.
7f) Tighten the bolts in a star pattern.
8f) Lay the CRT assembly on its side with the plug pointing up.
9f) Remove the plug.
10f) Using the PTV coupling fluid bottle with the cone top, refill the coupler with fluid through the drain access hole. Completely fill the coupler chamber so the fluid is level with the top of the coupler at the plug. Wipe any excess fluid from around the coupler.
11f) Reinstall the plug and check for any fluid leaks.
12f) Install the repaired CRT/optical block assembly into the PTV and perform any necessary adjustments.

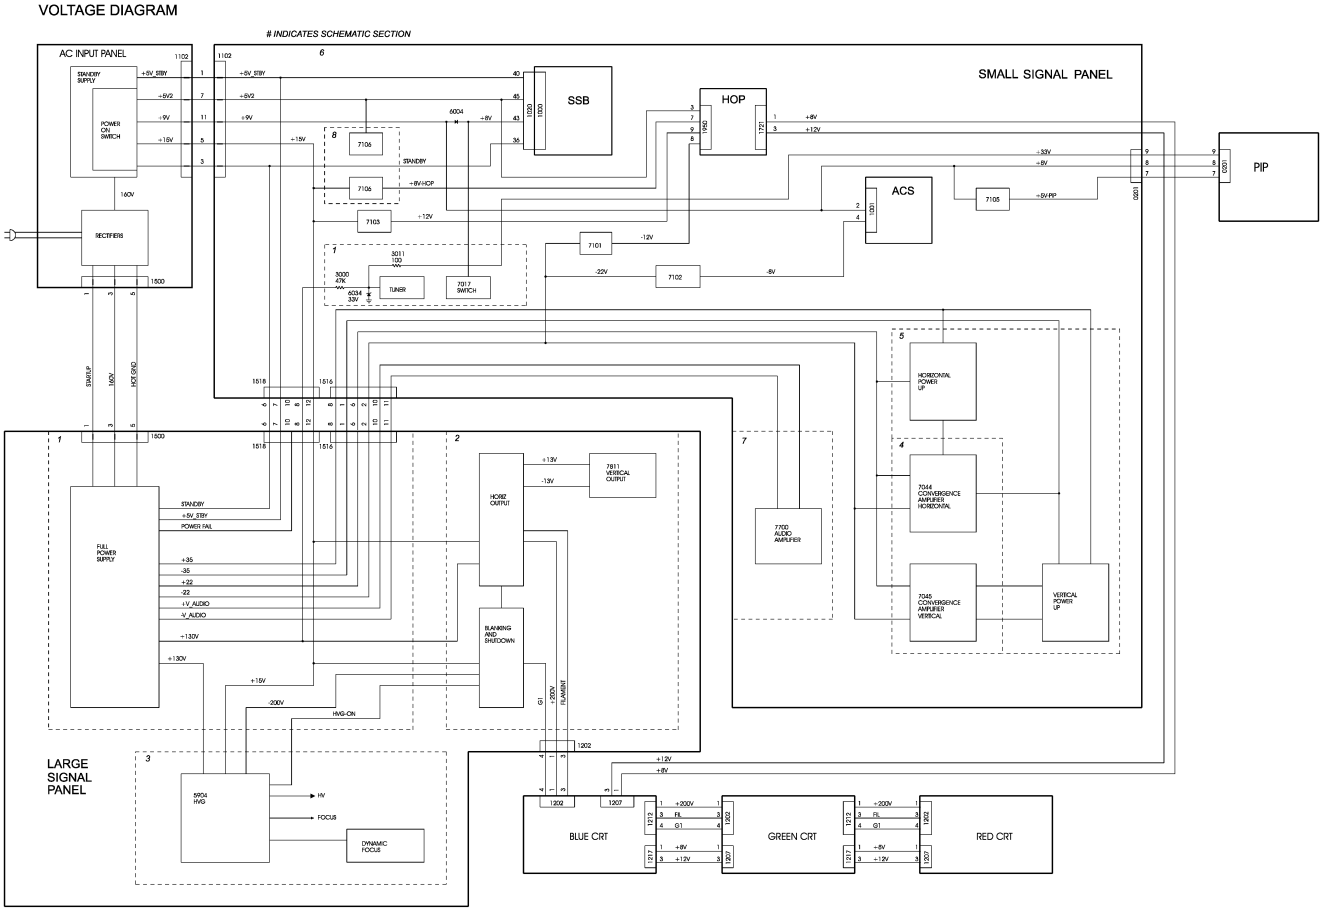
DPTV300 Series Chassis Adjustments

The following topics are covered:

- Service Modes
- Error code buffer and error codes
- The “blinking LED” procedure
- Trouble shooting tips
- Customer Service Mode



Measurements should be performed under the following conditions:
Video: color bar signal
Audio: 3kHz left, 1kHz right

Service Default Mode (SDM)

Introduction

The **Service Default Mode** (SDM) is a technical aid for the service technician. The Service Default Mode (SDM) establishes fixed, repeatable settings of customer controls, which allow consistent measurements to be made. The SDM also initiates the blinking LED procedure and, if necessary, overrides the 5V protection.

The SDM places the set in the following pre-defined conditions:

- Tuning frequency set to channel 3.
- Volume level set to 25% (of the maximum volume level).
- Other picture and sound settings set to 50% (mid-range).

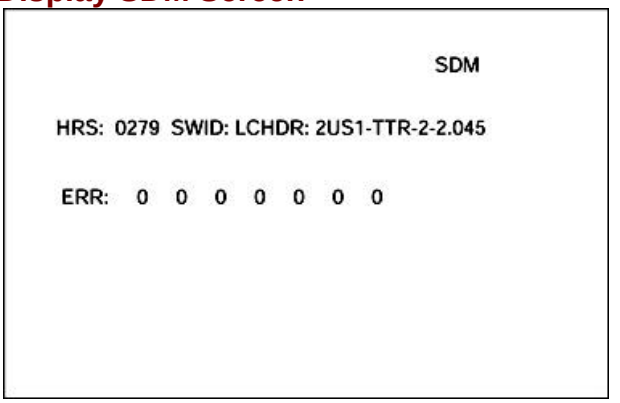
The following functions are turned OFF while in SDM:

- Timer
- Sleep timer

The following functions are disabled during SDM (and enabled after leaving SDM):

- Parental lock
- Blue mute
- Hospitality Mode
- No-ident Timer (normally the set is automatically switched off when no video signal (IDENT) is received for 15 minutes).

All other controls operate normally.



Entering Service Default Mode

To enter the Service Default Mode, press the following key sequence on the remote control transmitter:

0-6-2-5-9-6-MENU

Do not allow the display to time out between entries while keying the sequence.
Upon entry into the Service Default Mode, the letters “SDM” will be displayed at the upper right corner of the screen.

Display SDM Screen

Special SDM functions

Access to normal user menu

Pressing the “MENU” button on the remote control switches between the SDM and the normal user menus (with the SDM mode still active in the background)

Run timer, software identification, and error buffer

Press the Status button on the remote control to toggle the OSD (except “SDM”) ON and OFF to prevent the OSD from interfering with measurements and oscilloscope waveforms.

Access to SAM

To access the Service Alignment Mode while in the SDM press the “VOLUME +” and “VOLUME –“ buttons on the local keyboard simultaneously for at least 4 seconds.

Exiting Service Default Mode

To exit the Service Default Mode, press the Power button.

Note: To save the error codes, unplug the AC power cord without turning off the set. When the power is turned back on, the Service Default Mode will still be active.

Service Alignment Mode (SAM)

Introduction

The Service Alignment Mode (SAM) is used to align the set and/or adjust the option settings and to display/clear the error code buffer values.

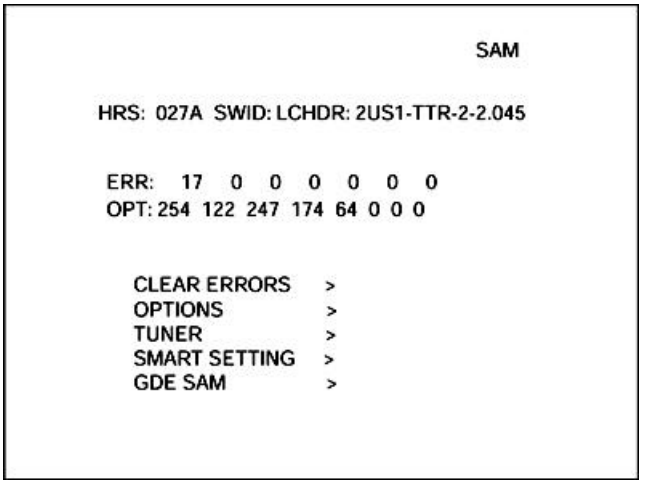
Entering Service Alignment Mode

To enter the Service Alignment Mode (SAM), press the following key sequence on the remote control transmitter:

0-6-2-5-9-6-STATUS

Do not allow the display to time out between entries while keying the sequence

It is also possible to enter the Service Alignment Mode by pressing the “VOLUME +” and “VOLUME -” key on the local keyboard simultaneously for at least 4 seconds when the set is in SDM.



Exiting SAM:

To exit the Service Alignment Mode, press the Power button.

Note: To save the error codes, unplug the AC power cord without turning off the set. When the power is turned back on, the Service Alignment Mode will still be active.

In SAM the following information is displayed on the screen:

Display SAM Menu

Explanation of SAM Menu:

1	**Operation Hours (Run Timer):** This display indicates the accumulated total of operational hours. (Shown in hexadecimal format)
2	**Software identification of the main micro controller (2US1-2.045)** **LCHDR** is the engineering chassis name for the HDR2002-PTV chassis. · **US1** is 2 letter and 1 digit combination to indicate the software type and the supported languages: · **US** = NAFTA · **1** = Main Software language version number · 2**.045** = sub-version number
3	**Error buffer (7 errors possible):** Displays the 7 most recent errors. The most recent error is displayed at the upper left.
4	**Option bytes (8 codes possible):** Summary of options is explained below.
5	**Sub menus are listed in a scroll menu.**

SAM Menu Control

Menu items may be selected using the cursor UP/DOWN keys.

- the selected item will be highlighted.
- when not all menu items will fit on the screen, pressing the cursor UP/DOWN keys on the remote transmitter will display the next/previous menu items.

With the cursor LEFT/RIGHT keys, it is possible to:

- activate/deactivate the selected menu item (e.g. GEOMETRY)
- change the value of the selected menu item (e.g. VER-SLOPE)
- activate the selected submenu (e.g. SERV-BLK)

Access to normal user menu

Pressing the “MENU” button on the remote control switches between the SAM and the normal user menus (with the SAM mode still active in the background). Pressing the “MENU” key in a submenu will return the screen to the previous menu.

Menu and Sub-menu Definitions

Clear Errors

Erases the contents of the error buffer. Select the CLEAR ERRORS menu item and press the cursor LEFT or cursor RIGHT key. The contents of the error buffer are cleared.

The functionality of the OPTIONS and ALIGNMENTS (TUNER, WHITE TONE, GEOMETRY, SOUND, and SMART SETTING) sub-menus are described in the service adjustments.

Error code buffer and error codes

Explanation of the Error code buffer

The error code buffer contains all errors detected since the last time the buffer was erased. The buffer is written from left to right. When an error occurs that is not yet in the error code buffer, the error code will appear at the left side and all other errors shift one position to the right.

The error code buffer will be cleared in the following cases:

- by activating CLEAR ERRORS in SAM menu
- exiting SDM or SAM with the “Standby" command on the remote control
- upon automatic reset when content has not changed for 50 consecutive hours

By leaving SDM or SAM via the power switch, the error buffer will not be reset.

Examples:

ERROR: 0 0 0 0 0 0 0 : No errors detected
ERROR: 6 0 0 0 0 0 0 : Error code 6 is the last and only detected error
ERROR: 9 6 0 0 0 0 0 : Error code 6 was first detected and error code 9 is the last detected (newest) error

The contents of the error buffer can also be displayed by use of the “blinking LED” procedure, if no picture is available. See explanation of “The blinking LED procedure “below.

Error code definition

In case of non-intermittent faults, clear the error buffer before starting the repair. Make sure “old” error codes are not present. If possible check the entire content of the error buffers. In some situations an error code is only the result of another error code (and not the actual cause).
Note: A fault in the protection detection circuitry can also lead to a protection.

Error codes 1,2, 3, and 4 are protection codes, and in this case the supplies of some circuits will be switched off. Also in protection, the LED will blink the number of times equivalent to the most recent error code.

The Blinking LED Procedure

The contents of the error buffer can also be made visible through the “blinking LED” procedure. This is especially useful when there is no picture.

- When the SDM is entered, the LED will blink the number of times equal to the value of the error code. Error-codes equal to or greater10 are shown in the following manner: A long blink of 750 mSeconds indicating the decimal digit, followed by a pause of 1500 mSeconds. The LED will then blink the number equal to the error code. When all error-codes are displayed, the sequence is finished with an LED display of 3 seconds. At this point the sequence will begin again.

Example:

Error code position	1	2	3	4	5
Error buffer:	12	9	6	0	0

- After entering SDM: The sequence will begin with 1 long blink of 750 mSeconds, then pause 1500 mSeconds, then blink twice (indicating error code 12), then the LED will pause for 3 seconds, then blink 9 times (indicating error code 9), then the LED will pause for 3 seconds, then blink 6 times (indicating error code 6), then pause 3 seconds and blink for 3 seconds again, ending the blinking sequence.

NOTE: If errors 1, 2, 3, or 4 occur the LED ALWAYS blinks indicating the last error which occurred, even if the set is NOT in service mode.

ELECTRICAL FOCUS ADJUSTMENT

Note: Before beginning the following adjustment procedures set the customer picture, sharpness, brightness, and tint controls to midrange and the customer color control to minimum.

Electrical Focus Adjustment

1. Remove the back cover of the set and the light shield, then turn the set on and inject an NTSC crosshatch pattern signal into the antenna terminal.

Note: The crosshatch pattern will appear clearer if the front of the screen is covered with a dark cloth.

2. Cover two of the CRT output lenses with cardboard pieces (or other non-conductive opaque material) to observe the magnified reflection of the other picture tube on the back side of the viewing screen.
3. Adjust the CRT's focus control (located on the Screen/Focus Control Block) for the sharpest raster image.
4. Confirm correct focus by viewing the screen from the front of the set.
5. Repeat steps two through four to adjust the focus of the two remaining CRT's.

Note: Before beginning the following adjustment procedures, set the customer picture, sharpness, brightness, and tint controls to midrange and the customer color control to minimum.

OPTICAL FOCUS

1. Remove the back cover of the set and the light shield, then turn these on and inject an NTSC crosshatch pattern signal into the antenna terminal.
   Note: The crosshatch pattern will appear clearer if the front of the screen is covered with a dark cloth.
2. Cover tow of the CRT output lenses with cardboard pieces (or other non-conductive, opaque material) and observe the magnified reflection of the other picture tube on the back side of the viewing screen.
3. Loosen the lens retaining wing nuts on the CRT Focus Assembly.
4. Move the wing nut in the slot of the uncovered lens to locate the optimum optical focus (viewing the picture from the back side of the screen), then re-tighten the wing nut.
5. Confirm correct focus by viewing the screen from the front of the set.
6. Repeat steps two through five to adjust the focus of the two remaining CRT's.

Picture Tube Replacement

Replacement of the cathode ray tube (CRT) and/or optical system components of a Projection TV (PTV) can be easily accomplished by following general guidelines. Use care when working around the CRT and optical systems of the PTV. The PTV light path encompasses a number of precision optical components. These include lenses, mirrors, the lenticular screen, and fresnel lens. The PTV incorporates three separate CRTs, representing green, red, and blue outputs. Each CRT uses an independent deflection/convergence yoke, magnetic centering ring, coupler, C-element lens, and output lens (A/B lens). Each tube is mechanically fastened to a coupler which houses fluid (a glycol-type substance) used to cool the high temperatures generated by the small (7") CRTs. The fluid also provides an optical characteristic supporting the optical system of the PTV. When replacement of a CRT or optical component is required, caution must be exercised in preventing fluid spillage. The technician must carefully reassemble the CRT/optical components, ensuring a proper seal of the coupling fluid. Use only factory original coupling fluid.

Caution: Do not use or add water as an alternative to the prescribed coupling fluid.

The following procedure should be used when performing repairs on the CRT/optical assemblies of the Projection TV.

Note: Upon completion of CRT/optical assembly repair, the centering, convergence, gray scale, mechanical and electrical focus adjustments are required. If more than one assembly requires repair, it is recommended the service technician fully complete one assembly at a time, using the existing assemblies as a reference for the alignment of the centering and convergence.

Disassembly Procedures

A. Removal of a single CRT/Lens Assembly from the light rack

1a) Remove AC power from the PTV.

2a) Remove the upper and lower back covers (1/4" screws).

3a) Remove the barrier board and the shield cover from around the lens assemblies (1/4" screws).

4a) Carefully remove the CRT Socket Board from the CRT of the CRT/optical assembly being serviced.

5a) Remove the yoke and convergence plugs, of the CRT/optical assembly being serviced, from the Large Signal Module.

6a) Remove the high voltage anode lead from the HV splitter block on the Large Signal Module of the CRT/optical assembly being serviced. Remove ground lug connectors from the coupler frame.

7a) Remove the four 1/4" screws that secure the CRT/lens assembly to the light rack. These four screws are located in each corner, on the top of the coupler assembly.

Caution: Do not remove the bolts with pressure springs or the inverted Torx screws of the CRT/lens assembly. The removal of these components could result in fluid spillage into the PTV cabinet.

8a) Carefully remove the CRT/lens assembly from the PTV cabinet.

Servicing the CRT/Optical Assembly

Caution: Do not attempt any repairs on the CRT/optical block assembly without first removing the CRT coupling fluid. Removal of the delta output lens will result in spillage of the coupling fluid.

Caution: Coupling fluid is a poisonous solution containing a high concentration of ethylene glycol. Do not leave exposed fluid unattended. Prevent children or pets from coming into contact with the fluid. Clean up spills immediately.

B. Removing the PTV Coupling Fluid

All repairs made to the CRT/optical block assembly require the removal of the coupling fluid. The following procedure describes how to remove the PTV coupling fluid.

1b) Lay the CRT assembly on its side with the plug pointing up.

2b) Remove the plug (X8).

3b) Remove some of the fluid from the coupler to prevent spillage when the CRT is removed. An empty coupling fluid bottle with a cone top is recommended to lower the fluid level within the coupler. Squeeze and hold the bottle and insert the tip of the cap into the drain hole of the coupler. Loosen the grip on the bottle, allowing the fluid to be pulled up into the bottle. Save the fluid.

4b) Reinstall the plug (X8).

5b) Stand the CRT assembly up with the neck of the CRT pointing up.

6b) With an awl or marking pen, outline the edges of the CRT onto the coupler.

Note: The correct positioning of the CRT to the coupler is critical to the optimum performance of the optical system.

7b) Remove the four CRT mounting bolts (A) (with springs and spacers) and remove the mounting bracket (D).

8b) Remove the four CRT mounting ear screws.

Note: The CRT mounting ear screws are not used on some assemblies.

9b) Gently remove any metal shavings from around the screw holes. Do not allow the metal shavings to get into the fluid.

10b) Note the position of the high voltage anode cap with respect to the coupler.

11b) Carefully remove the CRT from the coupler. Wipe any excess fluid from the faceplate of the CRT. Set the CRT aside.

12b) Use an empty coupling fluid bottle to extract the remainder of the fluid from the coupler.

Note: Complete removal of the coupling fluid is not necessary when only replacing the CRT.

13b) Clean any remaining fluid from the coupler and the CRT gasket channel using absorbent tissue. Refer to "C". Cleaning the Coupler, C-element Lens and CRT Faceplate procedure if the fluid is discolored or contaminated.

14b) Make all necessary repairs.

C. Cleaning the Coupler, C-element Lens and CRT Faceplate

1c) Remove CRT coupling fluid as described in steps 1b through 13b.

2c) Using denatured alcohol on a cloth made of 100% cotton or a lens cleaning tissue, gently clean the C-element (fisheye) lens, coupler and the CRT faceplate. Thoroughly clean the coupler assembly, including the expansion chamber bladder, and allow to fully dry.

Caution: Do not use soap or detergent type substances to clean the coupler and its related assemblies. Water can be used as an alternative to denatured alcohol, but the assemblies must be completely dry prior to reassembly of the coupler and the addition of the coupling fluid. A hair dryer may be used to dry the coupler and its assemblies prior to reassembly. If contaminated fluid is discovered, the coupler and its related assemblies must be completely disassembled and cleaned to prevent a reoccurrence.

3c) Replace the CRT and C-element lens gaskets.

4c) Reassemble the C-element lens and the output lens to the coupler.

5c) Refer to "Replacing the CRT Coupling Fluid" upon completion of necessary repairs and cleaning of the optical/coupler assemblies.

D. Replacement of the CRT

1d) Remove CRT coupling fluid as described in steps 1b through 13b.

2d) Remove the plastic protective coating (if present) from the faceplate of the replacement CRT.

3d) Refer to "Replacing the CRT Coupling Fluid" to complete the CRT replacement.

E. Repair or Replacement of the Optical/Coupler Assembly

1e) Remove CRT coupling fluid as described in steps 1b through 13b.

2e) Remove the four inverted-type Torx screws which secure the Delta output lens to the coupler. An inverted-type Torx socket can be purchased using part number 483539517303.

3e) Removal of the Delta output lens will allow access to the C-element lens, C-element gasket, coupler, and its assemblies.

4e) Refer to "Replacing the CRT Coupling Fluid" upon completion of necessary repairs to the optical/coupler assemblies.

F. Replacing the PTV Coupling Fluid

Note: Prior to replacing the CRT coupling fluid, ensure the expansion chamber bladder is fully collapsed. This can be easily inspected by viewing the bladder through the small hole on the expansion chamber assembly. If the rubber of the bladder is not easily visible through the small hole, then the bladder may be considered collapsed and fluid can be added. If the rubber of the expansion chamber bladder is visible at the hole of the expansion chamber, then replacement of the expansion chamber bladder is required.

Note: The CRT coupling fluid is critical to the optical performance of the PTV. Use only part number 483531057233 (3 bottle kit) or 483531067004 (1 bottle) to ensure the optical integrity and performance reliability of the PTV when replacing the CRT coupling fluid.

1f) Reinstall the CRT gasket into the gasket channel of the coupler. Confirm the placement of the CRT, C-element lens, and vent plug gaskets.

2f) Place the CRT onto the coupler with the high voltage anode lead positioned as marked in step 10b of procedure B.

3f) Carefully position the CRT onto the coupler, using the outline defined in step 6b of procedure B as a reference.

4f) Start the CRT mounting ear screws but do not tighten them.

5f) Tighten the CRT mounting ear screws in a star pattern (like tightening lug nuts on the wheel of a car). Make sure the CRT does not shift position from the outline defined in step 6b.

Caution: Do not over tighten the CRT ear screws.

Note: The CRT mounting ear screws are not used on some assemblies.

6f) Install the CRT mounting bracket and start the four CRT mounting bracket bolts with springs.

7f) Tighten the bolts in a star pattern.

8f) Lay the CRT assembly on its side with the plug pointing up.

9f) Remove the plug.

10f) Using the PTV coupling fluid bottle with the cone top, refill the coupler with fluid through the drain access hole. Completely fill the coupler chamber so the fluid is level with the top of the coupler at the plug. Wipe any excess fluid from around the coupler.

11f) Reinstall the plug and check for any fluid leaks.

12f) Install the repaired CRT/optical block assembly into the PTV and perform any necessary adjustments.

Convergence and Geometry adjustments

Completely read the Setup section before proceeding with any adjustment. The set should be allowed to warm up for at least 20 minutes before any adjustments are made.

Introduction

There are six new screen sizes for the High Definition Ready sets for the 2002 model year.

Model	Chassis	Screen Size	Aspect Ratio	Template Used	Type
43PP9202	DPTV305	43"	4x3	ST4177	Basic
50PP9202	DPTV305	50"	4x3	ST4178	Basic
55PP9352	DPTV320	55"	16x9	ST4181	Core
55PP9502	DPTV315	55"	16x9	ST4181	Basic
60PP9202	DPTV305	60"	4x3	ST4179	Basic
60PP9502	DPTV315	60"	16x9	ST4182	Core
60PP9352	DPTV310	60"	16x9	ST4182	Basic
46PP9302	DPTV330	46"	16x9	ST4180	Basic

All of these sets incorporate a Digital Convergence system using 208 adjustment points. The Convergence Processor is located on the ACS (Automatic Convergence System) module. The Convergence drive circuits are located on the SSP (Small Signal Panel). Data for the Convergence settings are stored in the EEPROM located on the ACS module. Data for Geometry is stored in the EEPROM located on the Small Signal Board (SSB). If the CRTs, the Large Signal Panel (LSP), or the Small Signal Board (SSB) are changed, a complete Geometry and Convergence alignment will be necessary. If the ACS module, the Small Signal Panel (SSP), or CRTs are changed, a complete Convergence alignment will be necessary**. To obtain the correct Geometry during Convergence, a template must be used.**

The 4x3 Aspect ratio sets have three Convergence and Geometry settings. The 16x9 Aspect ratio sets have two Convergence and Geometry settings. The 4x3 Aspect ratio sets have a 480p mode, a 1080i full screen mode, and a 1080i Compressed mode. There are Geometry and Convergence settings for each mode.

There are two chassis versions: Basic, and Core. The Core version is equipped with an Automatic Convergence system called Intellisense. The Intellisense system makes minor changes in the Convergence to compensate for changes in the magnetic field from one location to another. In the Convergence procedure, both versions have the setup for the Intellisense sensors. If "Test Sensors" is selected in the basic version, a message will appear on the screen indicating that the sensors are not working. **In the Basic version, the results of the sensor test are not applicable.**

When performing convergence or geometry alignments, the correct signal must be applied to the set. This is necessary to provide the correct horizontal and vertical sync to the Convergence Circuits. Failure to do so will result in an out of Convergence picture when the customer applies the correct signal to the set.
A NTSC signal should be used when adjusting the 480p mode. A 1080i signal should be applied to the set when using the HD mode. The HD should have a horizontal frequency of 33.75kHz and a vertical frequency of 60Hz. There are two Geometry and Convergence alignments in the HD mode for the 4x3 aspect ratio set. The two modes are a full screen mode (4x3) and a (16x9) compressed mode. These can be selected in the customer menu.

This adjustment procedure is divided into the following sections:

Screen Centering
Geometry Alignment
Convergence Alignment
Grey Scale Alignment

If the ACS module has been replaced, the following adjustment should be performed in the order listed:

Geometry
Convergence
Grey Scale

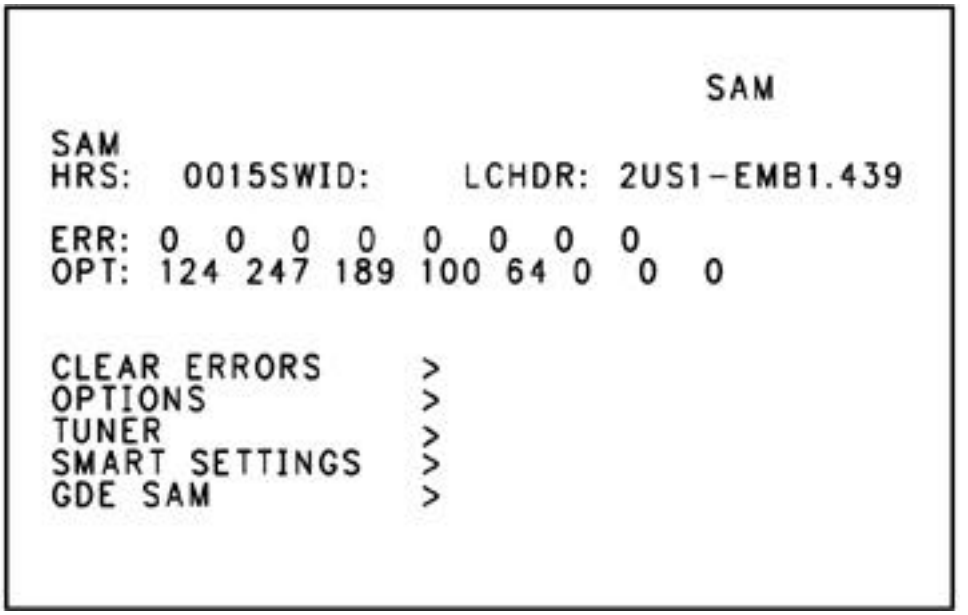
If the Large Signal Board (LSB) has been changed:

Screen Centering
Geometry
Convergence

If the CRTs have been changed:

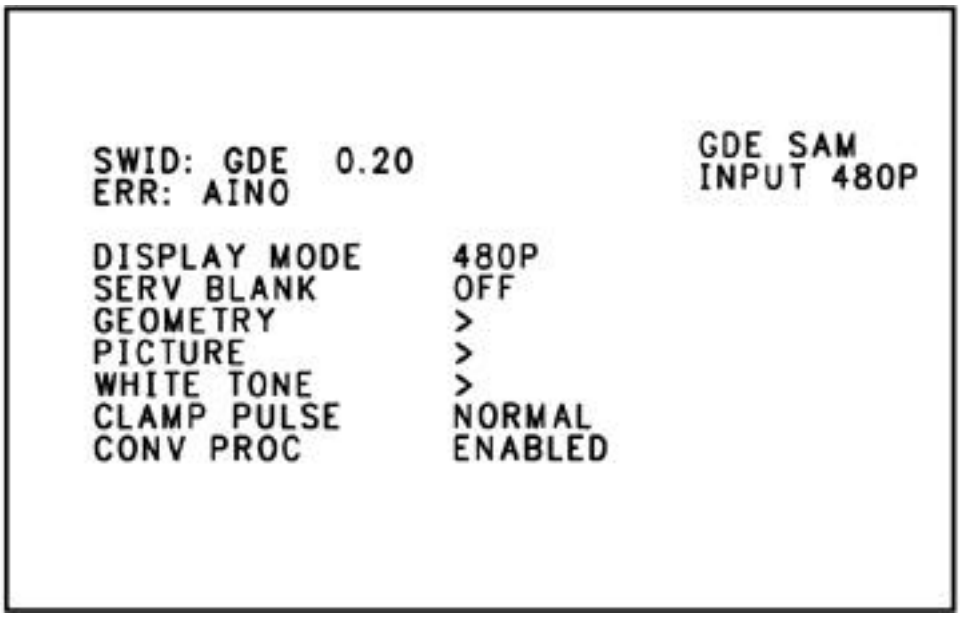
Screen Centering
Geometry
Convergence
Grey Scale

If the SSM (Small Signal Module) has been changed:



Convergence

Screen Centering



After replacing the CRTs, it will be necessary to perform Screen Centering. Place the Convergence Template on the TV screen or place a string from corner to corner to determine the screen center. Apply a center cross pattern to the TV. Enter the SAM mode, described in the Geometry section and disable Convergence. Cover the Red and Blue CRTs. Using the Centering rings on the Green CRT, center the cross onto the center of the template. Uncover the Red CRT and center the Red onto the Green cross. Follow the same procedure with the Blue CRT. Only perform the Screen Centering for the first mode to be adjusted. Do NOT repeat the adjustment for the other modes.

Geometry Alignment

The Geometry alignment data is stored in the NVM located on the ACS module. Whenever the ACS module or the Large Signal Board (LSB) has been changed, a Geometry alignment will be necessary. The Geometry Alignment is performed in the SAM/GDE alignment mode. To enter the SAM mode, press 0, 6, 2, 5, 9, 6, Index on the Remote Control. Make sure the set is in the mode in which you wish to align before entering the SAM mode. Use the AV button on the Remote to select the input with a signal applied after entering the SAM mode. The following screen will appear after entering the SAM mode. Press the Cursor Down key on the Remote to view SMART SETTINGS and GDE SAM.

Geometry settings are located in the GDE SAM mode. Press the Cursor down button to highlight the GDE SAM then press the Right Cursor button to select. The following menu will appear:

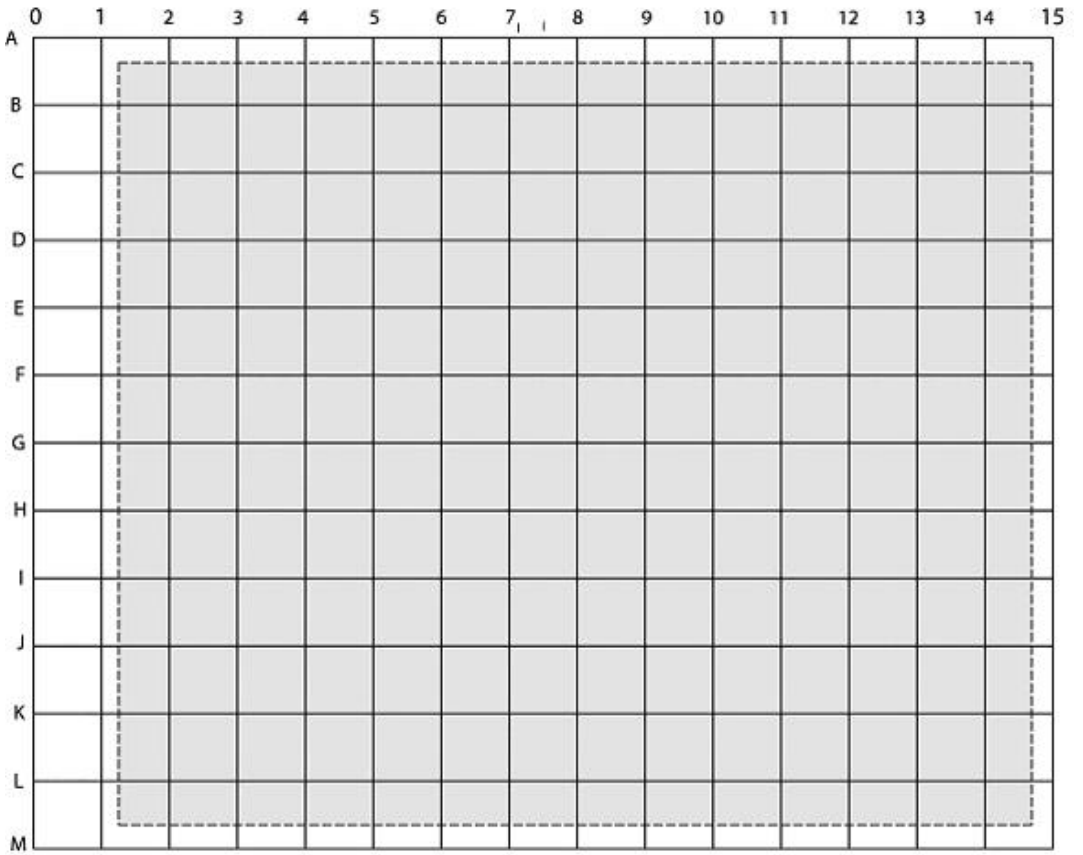
If the CRTs have been replaced, a Screen Centering adjustment will be necessary. Apply a crosshatch pattern to the set. Cursor Down to CONV PROC in the menu and press the Right Cursor button to select. This will disable the Convergence drive. Select Geometry in the menu and enter the following default values for the mode being adjusted. Other mode values can be entered by selecting a different DISPLAY MODE in the menu. In most cases, no additional adjustment will be necessary.

Geometry Default Values

	Mode 1 480p	Mode 2 1080i	Mode 3 1080i, Comp
Wide blank	7	7	7
Horizontal Shift	24	21	21
Horizontal Para	8	8	8
E-W Width	31	44	44
E-W Para	45	45	45
E-W Trap	31	31	31
Horizontal Bow	7	7	7
Vertical Slope	40	33	33
Vertical Amp	40	40	12
S Correction	31	31	31
Vertical Shift	31	31	31
Fast Blank	0	1	1

To exit the Service Alignment Mode (SAM), press the Menu key to return to the main SAM menu. Then turn the set Off.

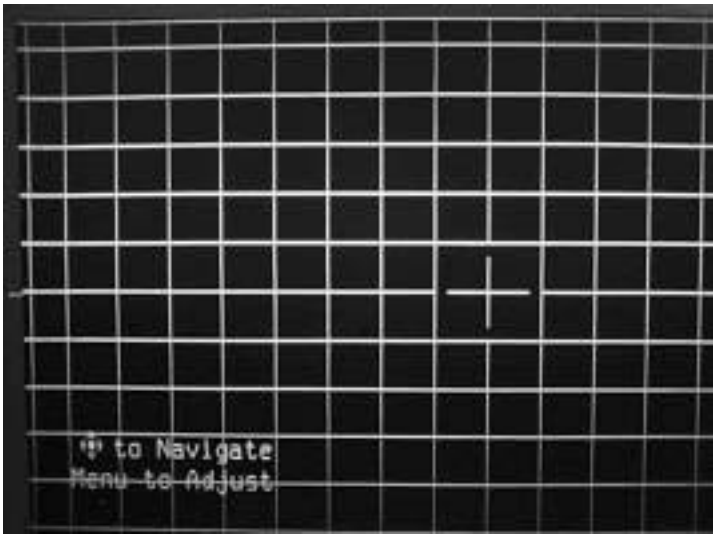
Convergence Alignment



To enter the Convergence Alignment mode, press 0, 6, 2, 5, 9, 7, Index on the Remote Control. Listed below is a map of the Convergence menus. Make sure that a signal is applied to the set for the mode being adjusted. Make sure that the set is in the mode you wish to adjust before entering the Convergence Alignment mode.

Convergence Menu Flow Diagram

Use the Cursor Up-Down button to highlight the selection. Press the Cursor Right button to make the selection. In the second menu, MANUAL CONVERGENCE WO VIDEO means that the screen behind the adjustment grid will be blank. MANUAL CONVERGENCE W VIDEO displays the applied video behind the adjustment grid. RESTORE FACTORY loads the values from the last saved convergence alignment. RESTORE DEFAULT loads values from the ROM on the ACS Microprocessor. If the ACS module has been changed, there may not be data in the NVM for RESTORE FACTORY. The RESTORE DEFAULT settings will then be loaded. Loading default values will overwrite all of the Convergence modes.



A internally generated grid will be displayed in the Convergence mode as shown below. The shaded area is the screen area. Horizontal lines A and M are displayed on the top and bottom edge of the visible screen area. Lines 1 and 15 are also displayed on the left and right edge of the visible screen area. Vertical line 0 is adjustable, but not visible.

Green Geometry

The Green Geometry must be done first when performing a complete convergence alignment. A Screen Template is necessary to obtain the correct geometry. Failure to use the Screen Template or misalignment of the convergence will result in reduced life of the Convergence amplifiers.

Place the Screen template on the TV screen. Select GREEN in the selection menu. The Cursor will appear in the center of the screen as shown below.

When the ACS module has been replaced and Default settings have been loaded, the following procedure should be used to adjust the convergence. Otherwise use the Cursor Up-Down and Right-Left buttons to Navigate to the area to be adjusted. Press the Menu button to adjust then use the Cursor buttons to move the Green cross onto the Template. The adjustment of the cross has two step sizes, large and small. Press the Menu button to toggle between the two. After a point has been adjusted, press the Index button to return to Navigate. When Default settings have been loaded, the leftmost line that is not visible should be adjusted first. Adjust the Vertical line 0 while observing line 1 to make line 1 parallel with the left edge of the screen. The adjustment should only be made in small steps. Do not adjust any one point more than 1/4 the distance of one grid. After the left most line is adjusted, start at the center left of the screen and work to the right, aligning the Horizontal line. When adjusting the Horizontal lines, best results are obtained when working from left to right. After the Center line is adjusted, go to the next line down until all of the lines have been adjusted. Then work from the center up to adjust the Horizontal lines. Using the same method, work from center out to adjust the Vertical lines. At least three passes will be necessary to complete the alignment. Press the Index button to return to the selection menu.

When the Green geometry is complete, Store the data. Remove the Template from the screen. Select Red to Green in the selection menu. Using the same method that was used to adjust the Green Grid to the Template, adjust the Red grid onto the Green Grid.

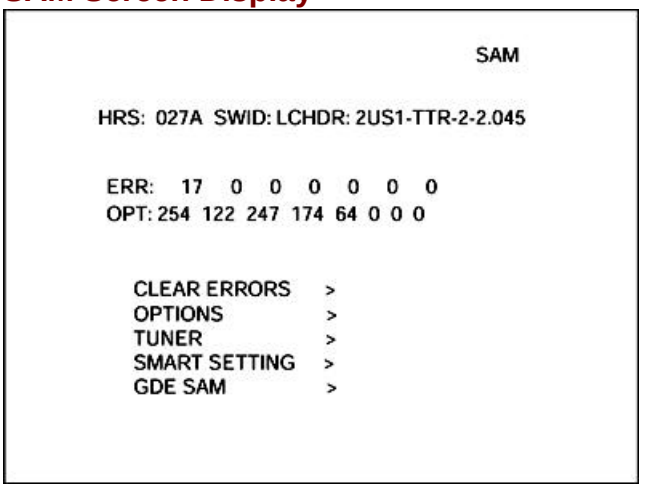
When the Red to Green is complete, select the Blue to Green using the same alignment method. Each time data is stored, the Intellisense circuit will recalculate the position of the four sensors in the set.

Repeat the adjustment for each of the remaining modes.

Gray Scale Alignment

1. Place the input to the RGB (Aux 5) or Y Pb Pr (Aux 4) mode. Connect a Computer or Computer monitor generator to the Aux 5 input or a Component Generator to Aux 4.
2. Preset the G2 controls counterclockwise.
3. Turn the Green G2 clockwise to make the menu visible.
4. Enter the SAM mode by entering 0, 6, 2, 5, 9, 6, Index on the Remote Control. Select the GDE mode and select WHITE TONE.
5. Preset the following registers: Use the Cursor Right-Left buttons to set the value. Use the Cursor Up-Down buttons to select the register. Press the Menu button to return to exit the WHITE TONE menu.

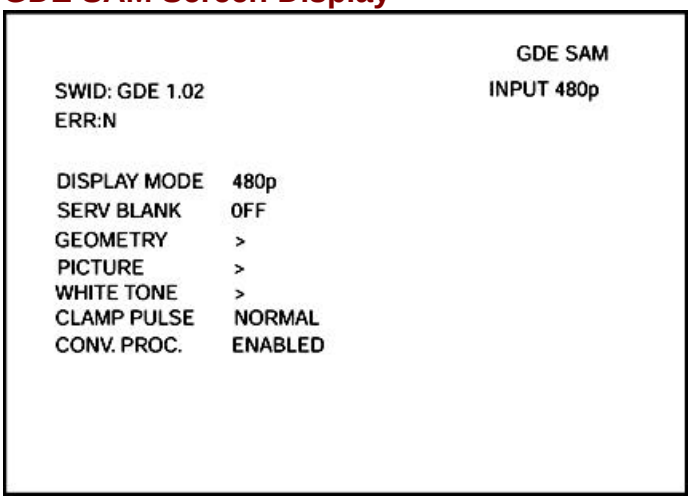
Name	**Value**
Red Cutoff	3F
Green Cutoff	3F
Blue Cutoff	3F
Red Drive	3F
Green Drive	3F
Blue Drive	3F



6. Set the Brightness, Picture, and Sharpness to their midpoint position. Select a Black Raster pattern on the computer or computer monitor generator.
7. Place a Scope set to measure DC on each cathode to determine the dominant (lowest) color.
8. Adjust the SUB BRIGHTNESS control to set the Black Level equal to 180 volts on the scope.
9. Move the probe to the remaining cathodes and adjust the corresponding cutoff registers to make the black part of the waveform at 180 volts.
10. Set the corresponding G2 control to just make cutoff for the black part of the waveform for that tube.
11. Remove the Scope.
12. Apply a Grayscale pattern to the set.
13. Adjust the Drive Controls to achieve the proper white balance. At least one drive should remain 3F.
14. The following Drives and Cutoffs should be set as listed. These are in the WHITE TONE menu.

Cool Cutoff Red	0
Cool Cutoff Green	0
Cool Cutoff Blue	0
Cool Drive Red	-7
Cool Drive Green	-6
Cool Drive Blue	0
Warm Cutoff Red	0
Warm Cutoff Green	0
Warm Cutoff Blue	0
Warm Drive Red	+7
Warm Drive Green	+4
Warm Drive Blue	-6

15. Press the Menu button to return to the SAM menu. Exit the Service mode by turning the set Off.



See GDE SAM MODE DEFAULTS TABLE

SAM Screen Display

The Geometry alignments are in the GDE SAM selection. Use the cursor up-down button to highlight the item. Use the right cursor button to select the item. Use the Menu button to return to the previous menu. The following menu will appear when GDE SAM is selected.

GDE SAM Screen Display

In this menu, the Display Mode can be selected. If the input signal is NTSC, the selection should be 480P. The selection **Serv Blank** causes the bottom half of the screen to blank. This selection is useful when adjusting the Yoke rotation. The **Conv Proc** selection allows for the disabling of the Convergence drive.

Default settings should be entered when the Small Signal Board (SSB) has been changed. When the CRTs have been changed, the display should be centered using the Centering rings on the CRT. The center point can be found by placing a string from corner to corner or by using the center point on the Convergence Template. In the 4x3 Aspect ratio sets, there are three Geometry settings. In the 16x9 Aspect ratio sets, there are two Geometry settings. Make sure the set is in the mode that is being adjusted and that the correct signal is applied.

Customer Service Mode (CSM)

All HDRPTV sets are equipped with the “Customer Service Mode” (CSM). CSM is a special service mode that can be activated and deactivated by the customer, by request of the service technician/dealer in order to identify the status of the set. This CSM is a 'read only' mode, therefore modifications in this mode are not possible.

Entering the Customer Service Mode.

The Customer Service Mode can be switched on:

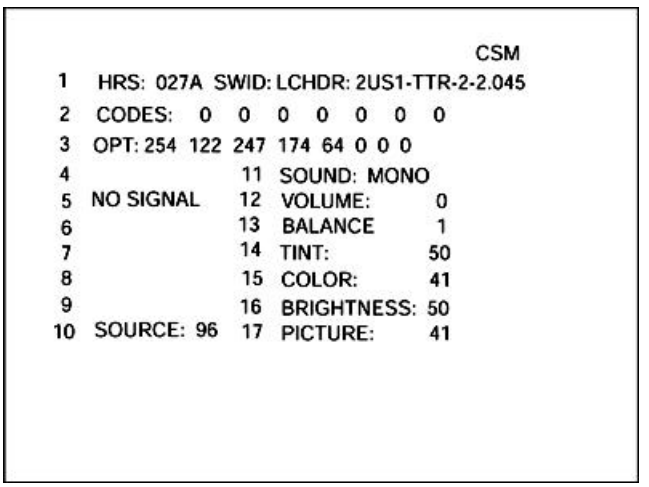
- By pressing the MUTE button on the remote control and any key on the local keyboard (Channel Up, Channel Down, VOL +, VOL -) on the TV simultaneously for at least 4 seconds.
  (Note: When CSM is entered, “CSM” may flash or may stay constant in the upper right corner.)

When the CSM is activated:

- picture and sound settings are set to nominal levels
- Modes that interfere with the behavior of the set are switched off (sleep timer, auto standby, etc.)

Exit the Customer Service Mode.

The Customer Service Mode will be switched off after:



- Pressing any key on the remote control (except “Channel Up” or “Channel Down”)
- Switching off the TV set by pressing the Power button on the remote control or the local keyboard.

Exiting CSM resets the TV set back to its initial values.

The Customer Service Mode information screen

Upon entry into the Customer Service Mode the following screen will appear.
All lines of information will appear on one screen.

Display of CSM Screen

The Customer Service Menu shows the following information:

– **Line 1 : "HRS : nnnn" and SWID : "2US1-BBC-X.YY"**

HRS:

Indicates the accumulated total of operational hours. (Shown in hexadecimal format.) (Standby hours are not counted as operating hours).

SWID:

Software identification of the main micro controller (2US1-TTR-1.00)
LCHDR is the chassis name for the HDR2002 PTV.

- **US1** is 2 letter and 1 digit combination to indicate the software type and the supported languages:
- **US** = NAFTA region
- **1** = Main Software language version number
- **2.045**= sub-version number

– **Line 2 : "CODES : xx xx xx xx xx xx xx "**

Error code buffer (see explanation of error codes above) Displays the last 7 errors of the error code buffer.

– **Line 3 : "OPT xxx xxx xxx xxx xxx xxx xxx xxx"**

Option bytes

Option bits control software and hardware functionality. An option byte or option number represents 8 of those bits. Each option number is displayed as a number between 0 and 255. The set may not work correctly when an incorrect option code is set. See Service Adjustments for more information on correct option settings

– **Line 4: "SYSTEM : AUTO"**

Indicates which color and sound system is installed for this preset:

– **NTSC/PAL/SECAM**

Complaints that may be caused by an incorrect system setting:

- no color
- colors not correct
- unstable picture
- noise in picture

To change the system setting of a preset:
Press the "MENU" button on the remote control
Select the INSTALL sub menu
Select the MANUAL STORE sub menu
Select and change the SYSTEM setting until picture and sound are correct
Select the STORE menu item

– **Line 5 : "NO SIGNAL"**

Indicates that the set is not receiving an "ident" signal on the selected source.

- no or bad antenna signal; connect a proper antenna signal
- antenna not connected; connect the antenna
- no channel / preset is stored at this program number; go to the INSTALL menu and store a proper channel at this program number
- the tuner is faulty (in this case the CODES line will contain number 13 or 16); check the tuner and replace/repair if necessary

Note: On some models (if the BM option is ON), BLUE MUTE is displayed when no signal is received.

– **Line 6 : “TIMER ON ”**

Indicates that the on/off timer is running.
The following Complaints may be caused by the activation of the sleep timer:
The set may turn on from standby or may switch to a different channel without using either the remote control or the local keyboard.

To switch off the activation timer:
Select “TIMER” in the “FEATURE” menu.
Select “ACTIVATE” in the “TIMER” menu.
Set to “OFF” with the left/right cursor keys.

– **Line 7 : “CHANNEL BLOCKED”**

Indicates that all channels are locked except the selected channel.
The following complaints may be generated due to locked channels:
– TV cannot be switched on from standby with the local keyboard buttons.
– “CH+” and “CH-“ buttons on local keyboard do not function.

To disable the LOCK feature:
Select ”FEATURE” menu (with the Remote Control).
Select “LOCK” (with the Remote Control).
Set to “OFF”

– **Line 8 : “NOT PREFERRED”**

Indicates that at least one channel is deleted as a preferred channel (by default, all channels are skipped).
Note that “SKIPPED” will always be displayed in CSM unless all the channels are not skipped.

To add a channel as a selected channel to the list of preferred channels:
Select “INSTALL” menu
Select “CHANNEL EDIT”
Select “ADD/DELETE”
Set to “ADD” with the left/right cursor keys

– **Line 9 : “HOTELMODE ON”**

Indicates that the Hotel mode has been activated.

– **Line 10 : “SOURCE :”**

Indicates which SOURCE is installed for this preset.
AV1, AV2, SVHS2, Channel number (8)

– **Line 11 : “SOUND”**

Indicates which sound mode is installed for this preset.
Mono, Stereo, SAP, NICAM, L1, L2, Virtual or Digital

– **Line 12 : “VOLUME”**

Value indicates level at CSM entry.

– **Line 13 : “BALANCE”**

Value indicates level at CSM entry.

– **Line 14 : “TINT”**
Value indicates level at CSM entry.

– **Line 15 : “COLOR”**
Value indicates level at CSM entry.

– **Line 16 : “BRIGHTNESS”**
Value indicates level at CSM entry.

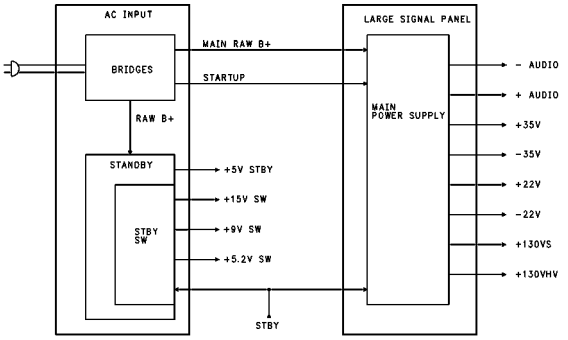
– **Line 17 : “PICTURE”**
Value indicates level at CSM entry.

INTRODUCTION

The HDR2002 is designed for the 2002 model year. The set is a High Definition Ready Projection television. High Definition Ready means the set will accept HDTV analog inputs. It does not have an ATSC tuner. The set is designed to accept RF, Component, and Composite signals in the NTSC format, Progressive Scan format, or 1080I Y Pr Pb formats. It comes in a 43 inch, a 50 inch, and a 60 inch in the 4x3 aspect ratio screens sizes. In the 16x9 aspect ratio sets, it comes in 46 inch, 55 inch, and 60 inch screen sizes.

- In these sets, a Line Doubler converts the NTSC input signal to a progressive scan format.
- All versions of the set have three NTSC composite or SVHS inputs
- They also have one NTSC Y Pr Pb component input.
- Additionally there is one High definition Progressive Scan or 1080I component input. The high definition input or progressive input signals can be either Y Pr Pb or RGB.

Feature differences divide these sets into three versions. They are Basic, Basic plus, and Core models.



Basic:
The Basic version is equipped with a 20 watt class D audio amplifier. It has a standard single PIP (Picture in Picture) mounted on a separate circuit board. It utilizes a 3 line Comb filter.

Basic Plus:
The Basic Plus version is also equipped with a 20-watt class D audio amplifier. It is equipped with a two-tuner standard PIP and uses a 3D Comb filter mounted on a separate circuit board. An additional HD input, DB15 (AV5) is located on the rear panel.

The Core version is equipped with a 30-watt class D audio amplifier and features a two tuner double window PIP system mounted on a separate circuit board. Like the Basic Plus, it incorporates a 3D comb filter. Other features are a DVI input connector, Auto Intellesense Convergence, Center Channel audio output and a line level Subwoofer output.

Overall Power Supply Block

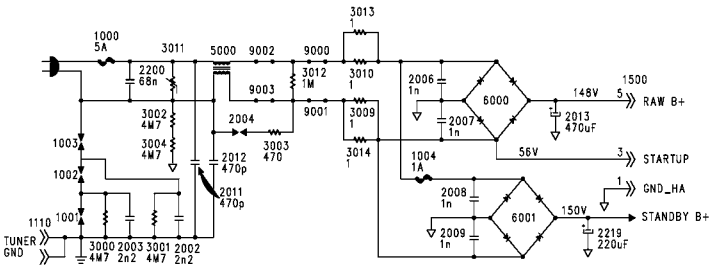


Figure 1

The Bridge rectifiers and Standby supply are located on the Input Panel. The Main Power supply is located on the Large Signal panel. The Standby supply produces +5 volt standby voltage. When the set is turned On, the Standby line goes Low, switching the Standby supply to produce +15 volt, +9 volt, and +5.2 volt sources. It also turns the Main Power supply On, which produces the Audio, +35,-35, +22, -22, +130VS, and +130VHV supplies. The +130VS supply is for the Horizontal Output section. The +130VHV supplies power to the High Voltage section.

AC Input Board

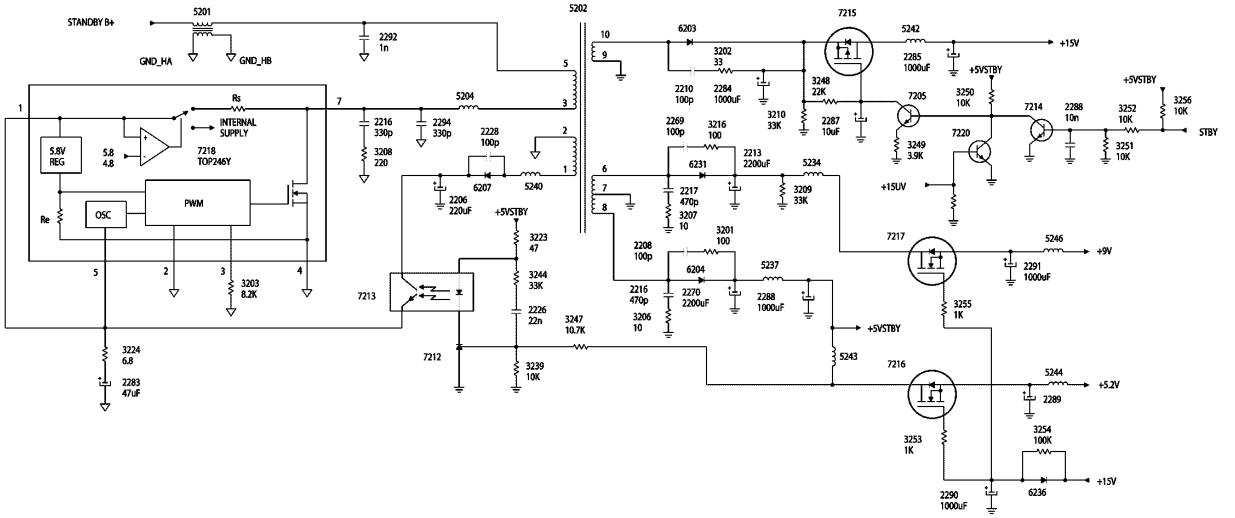

Figure 2

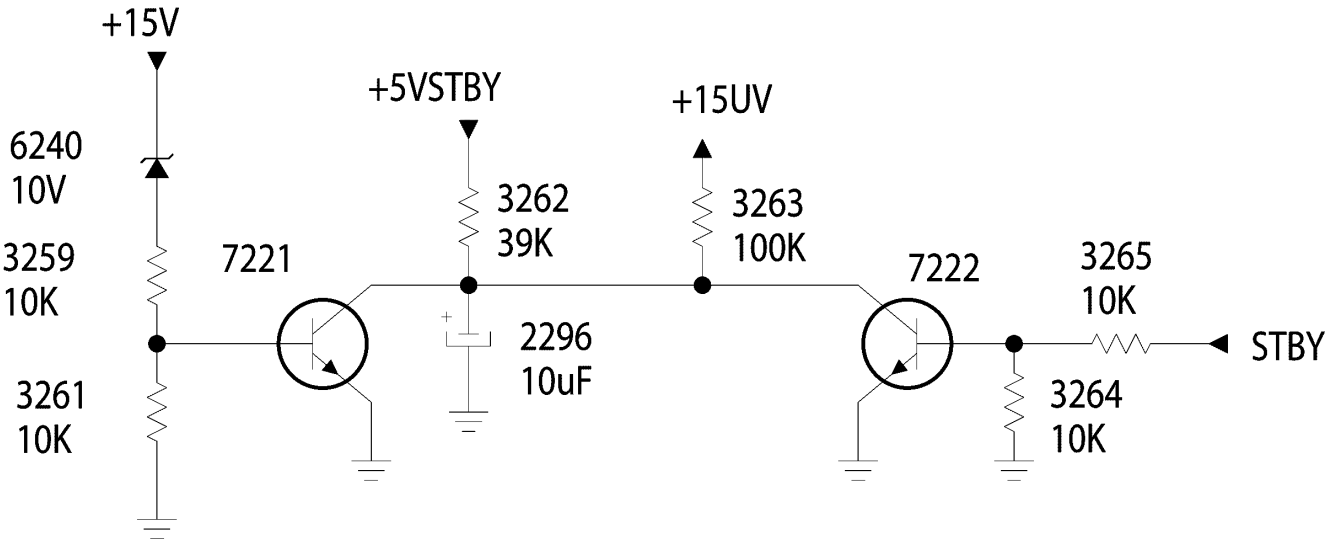
AC Power is fed to the Input Panel. A 5-amp fuse, 1000, provides protection. Choke 5000 provides filtering for the AC. 1003,1002,1001, and 3011 provide protection against Line Surges. Bridge 6001 rectifies the voltage for the Standby Power supply. Resistors 3009, 3014, 3013, and 3010 provide current limiting when power is first applied to the set. Bridge 6000 rectifies the voltage for the Main power supply. Startup voltage for the Main Power supply is taken from the neutral side of the AC line. Fuse 1004 provides protection for the Standby Power supply.

Standby Power Supply

Figure 3



Standby B+ is applied to the Standby Switching regulator 7218 via Pins 5 and 3 of 5202. An internal switch in 7218 charges capacitor 2283 connected to Pin 1 of the IC. When the charge on 2283 reaches 5.8 volts, the internal switch switches to internal. The IC is now being powered by the charge on capacitor 2283. The internal FET drives the transformer 5202 until the charge on capacitor 2283 reaches 4.8 volts. The IC repeats the cycle until the 5- volt Standby voltage reaches the correct level. Shunt regulator 7212 then turns On, turning the optoisolator 7213 On. The operating voltage for 7218 is then supplied by the rectified Hot secondary voltage from Pin 1 of 5202. The internal regulator keeps Pin 1 at 5.8 volts. Regulation is accomplished by monitoring the 5-volt standby voltage. If the 5-volt supply increases, the shunt regulator 7212 will conduct more, causing the resistance of the transistor inside 7218 to decrease. The sensing resistor, Re, inside 7218 will sense the increase in current and reduce the On time of the internal FET, which will lower the 5-volt supply to the correct level.

In Standby, the 5-volt Standby voltage is the only voltage being applied to the set. The +15, +9, and +5.2-volt sources are turned Off. When the set is turned On, the Standby Line goes Low, turning transistor 7214 Off, turning 7205 On, which turns 7215 On. This switches the +15-volt supply to the set. The +15-volt supply then switches transistors 7216 and 7217 On to switch the +9-volt and +5.2-volt supplies to the set. When the +15UV (Under Voltage detection) line goes High, transistor 7220 will turn On, which will turn 7205 Off. This will cause 7215 to turn Off, switching the +15, the +9, and the +5.2-volt supplies Off. This will cause the set to shut down.

Under Voltage Detection

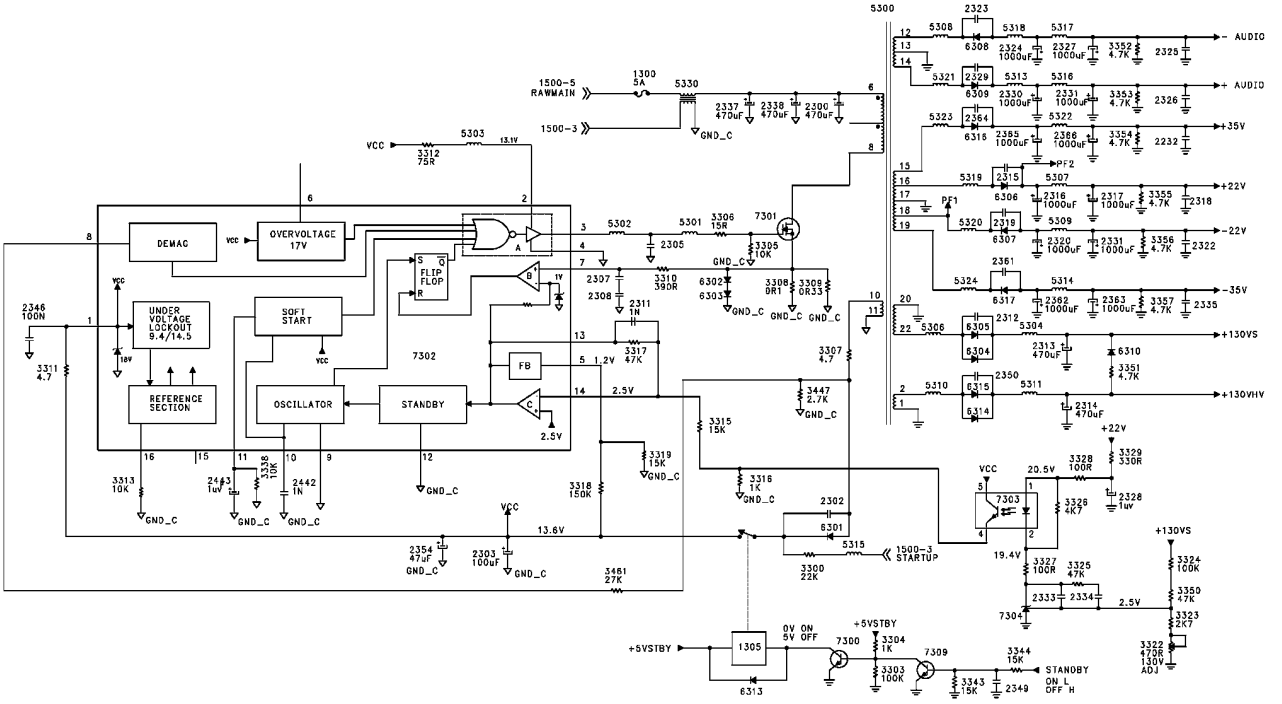


Figure 4

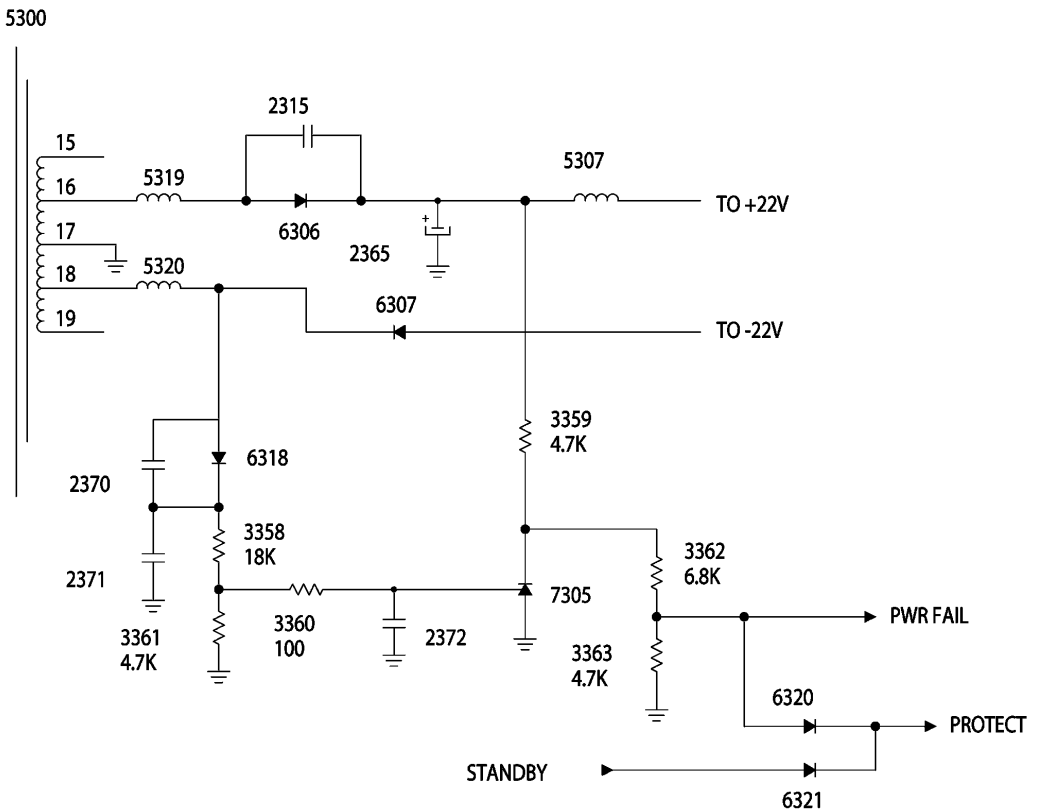
If the 15-volt supply drops below 11.2 volts, transistor 7221 will turn Off. The 5-volt standby supply will be applied to the base of 7220 via resistors 3262 and 3263. This will cause the +15UV line to go High. In the Standby mode, the Standby line is High turning transistor 7222 On. When the set is turned On, 7222 turns Off. Capacitor 2296 provides a delay to prevent the +15UV line from going High before the +15V supply turns On.

Full Power Supply

Figure 5

The Full Power supply is located on the Large Signal panel. The Raw B+ voltage from the Input panel is applied to the Full Power switching transistor, 7301, via Pins 6 and 8 of transformer 5300. This voltage is protected by Fuse 1300 and filtered by Choke 5330. The Standby line goes Low when the set is turned On. Transistor 7309 is turned Off, which turns 7300 On. This turns Relay 1305 On. Startup voltage is applied to Capacitor 2303 via resistor 3300. When 2303 charges to 14.5 volts, the undervoltage lockout of 7302 connected to Pin 1 is turned On. Drive is output on Pin 3 to the Switching FET, 7301. This drives 5300 to produce the Full power supply voltages. IC 7302 will continue to drive 5300 until the charges on capacitor 2303 drop below 9.4 volts. The Under Voltage Lockout of 7302 will then turn the output on Pin 3 Off until 2303 again charges to 14.5 volts. After several startup cycles, the operating voltage for 7302 is supplied by Pin 10 of 5300.



Regulation is accomplished by monitoring the 130VS supply via resistors 3324, 3350, 3323 and 3322. The Feedback voltage is applied to the Shunt Regulator 7304, which drives the Feedback optoisolator, 7303. The Feedback voltage is applied to Pin 14 of 7302. The voltage is fed to comparator "C" which is referenced to 2.5 volts. The output of this comparator sets the reference voltage for comparator "B" which is compared with the voltage on the source of 7301. This voltage is developed when 7301 turns On, causing current to flow through resistors 3308 and 3309. If 7301 fails, Resistors 3308 and 3309 should be replaced.

The Full Power supply produces two 130 volt, a 35 volt, a 22 volt, a minus 22 volt, a minus 35 volt, a plus audio supply, and a minus audio supply. The Audio supply is a plus and minus 19 volts in sets that use the 20-watt audio amplifier. The Audio supply voltages will be four volts higher in sets with a 30-watt audio amplifier.

When troubleshooting, notice that the Hot ground for the Full power supply is separated from the main Hot ground on the Input Panel by Choke 5330. To ensure correct readings, use the Hot ground in the Full power supply. If the power supply is overloaded or the operating voltage is missing, the voltage on Pin 1 of the IC will be changing between 9.4 and 14.5 volts. Each time the voltage reaches 14.5 volts, drive will appear on Pin 3 of the IC. If a voltage is present on Pin 1 that is greater than 14.5 volts, and there is no drive on Pin 3, the IC should be replaced. If drive is present on Pin 3, check for drive on the Drain of 7301. If drive is present here, check for a short on the 130-volt lines, a problem in the feedback circuit, or a problem with the operating voltage.

Power Fail Shutdown

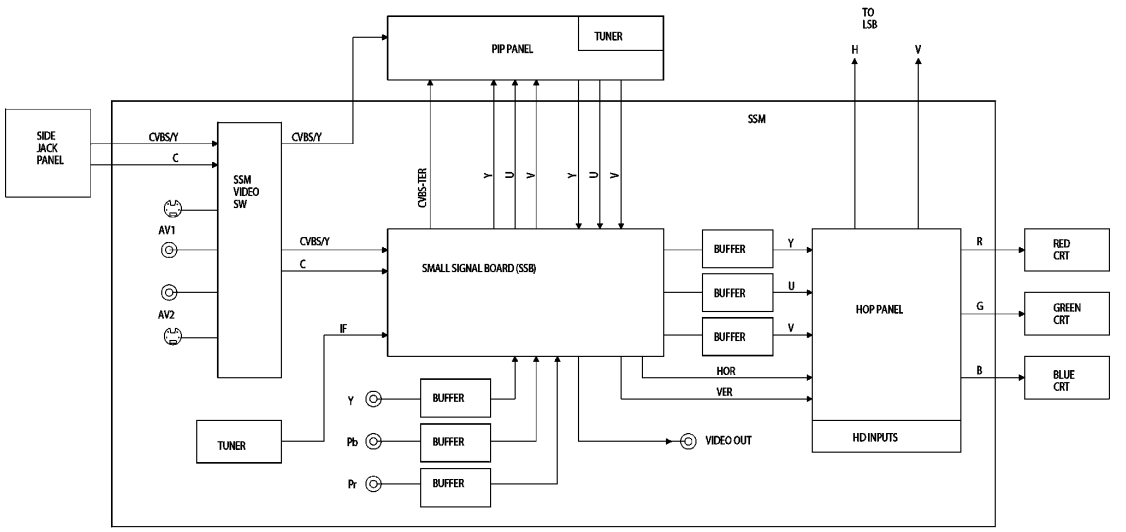


Figure 6

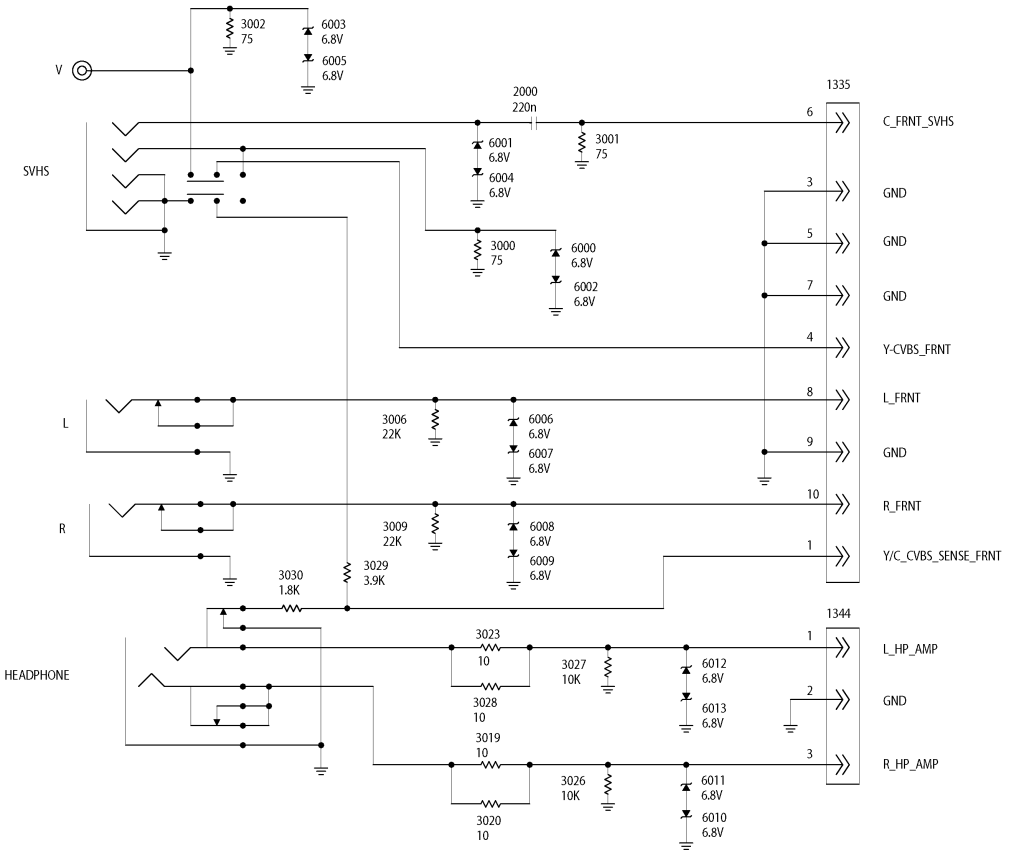
The +22-volt supply is rectified by 6306 and the negative 22-volt supply is rectified by 6307. The voltage on Pin 18 of 5300 is monitored to detect a failure of the AC supply to the set. This circuit signals the Microprocessor in the event that AC is removed from the set while it is turned On. The voltage from Pin 18 is rectified by 6318 and is applied to the Shunt Regulator 7305. Shunt Regulator 7305 is turned On, keeping the Power Fail and Protect lines Low. When AC is removed while the set is On, 7305 will turn Off fast. This is because the filter capacitor for the input to 7305 is small. When 7305 turns Off, the Power Fail line goes High from the voltage on the +22-volt line. The Microprocessor will shut the set down while it still has voltage to operate.

Video Signal Flow

Figure 7



The HDR2002 is able to accept inputs from NTSC sources, Progressive Scan inputs, and 1080I inputs. Composite Video or YC from the Side Jack panel is fed to the Video switch located on the SSM (Small Signal Module). The SSM Video switch selects between the Composite inputs or SVHS inputs of the Side Jack panel for the inputs located on the SSM. AV1 and AV2 inputs are located on the SSM. AV3 is the Side Jack panel input. Selected Composite video or YC is fed to the SSB (Small Signal Board) that plugs into the SSM. NTSC component video Y Pb Pr is buffered and fed to the SSB. Selected Composite Video is fed to the PIP panel for the PIP window picture information. In the Basic version, Composite video from the SSB is also fed to the PIP panel. In the Basic version, the PIP panel does not have a Tuner. The PIP panel does have a Tuner in the Basic + and Core version. The main Tuner is located on the SSM. IF from this Tuner is fed to the SSB. Composite video from the SSB, which is developed from the main Tuner, is fed to the PIP panel. Switching on the PIP panel selects between video from the main Tuner or from the Tuner on the PIP panel in sets with two-tuner PIPs. Selected Video is fed back to the SSB. YUV for the main picture from the SSB is fed to the PIP

panel for the Picture in Picture information to be inserted. After insertion of the PIP information, the YUV signal is fed back to the SSB. A line doubler circuit on the SSB called the Feature Box changes the interlaced NTSC signal to a Progressive Scan signal. This YUV signal is buffered and fed to the HOP panel. The HOP panel has the Progressive Scan and 1080I inputs. The Video processing circuits on this panel perform the Color, Tint, Brightness, and Contrast adjustments for the video. Signal selections between the Progressive Scan signal from the SSB and the HD inputs are performed on the HOP panel. Sync processing and selection are also performed on the HOP panel. Red, Green, and Blue drive from the HOP panel is fed to the three CRT panels. The 43-inch Core version will also have a DB15 RGB connector on the HOP panel. The 55 and 60-inch wide screen Core versions will have a DVI (Digital Video Interface) connector. There are two sets of connectors labeled Y Pb Pr. The one on the SSM is for NTSC signal levels only. The one on the HOP is for 1080I or 480p Progressive Scan only.

Side Jack Panel

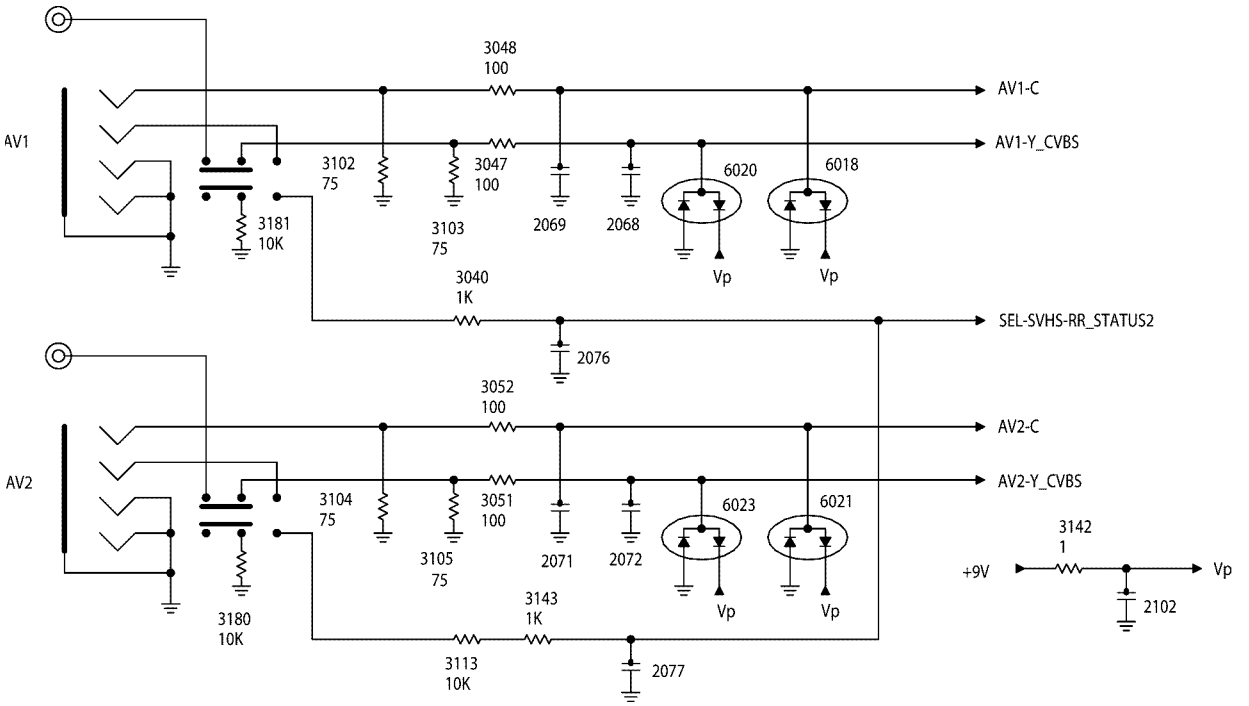


Figure 8

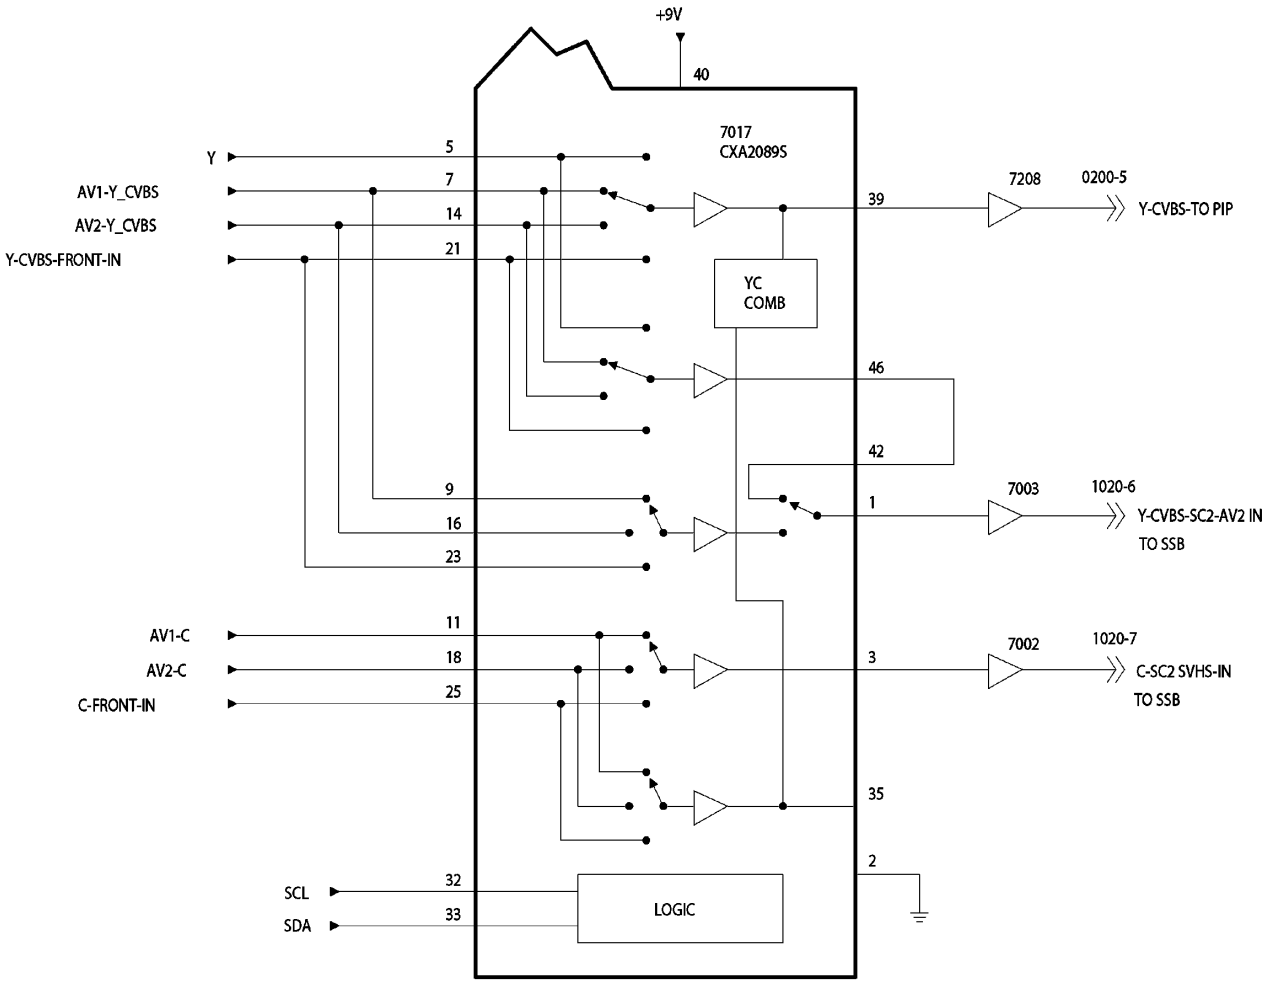
The Side Jack panel has a Composite Video and SVHS input. There is a left and right channel audio input. When there is a connector in the SVHS input, the Composite input is muted. A switching circuit signals the Microprocessor when there is something plugged into the SVHS or Headphone connectors.

Composite Inputs

Figure 9



The Composite inputs are located on the SSM. There are two Composite or SVHS inputs. A connector in the SVHS inputs will mute the Composite inputs. A connector in the SVHS inputs will cause a voltage change on the SEL-SVHS-RR_STATUS2 line. This will signal the Microprocessor that something is connected to that input.

Diodes 6018, 6020, 6021, and 6023 clamp the input signal levels to prevent an excessive voltage from being applied to the inputs.

SSM Video Switching

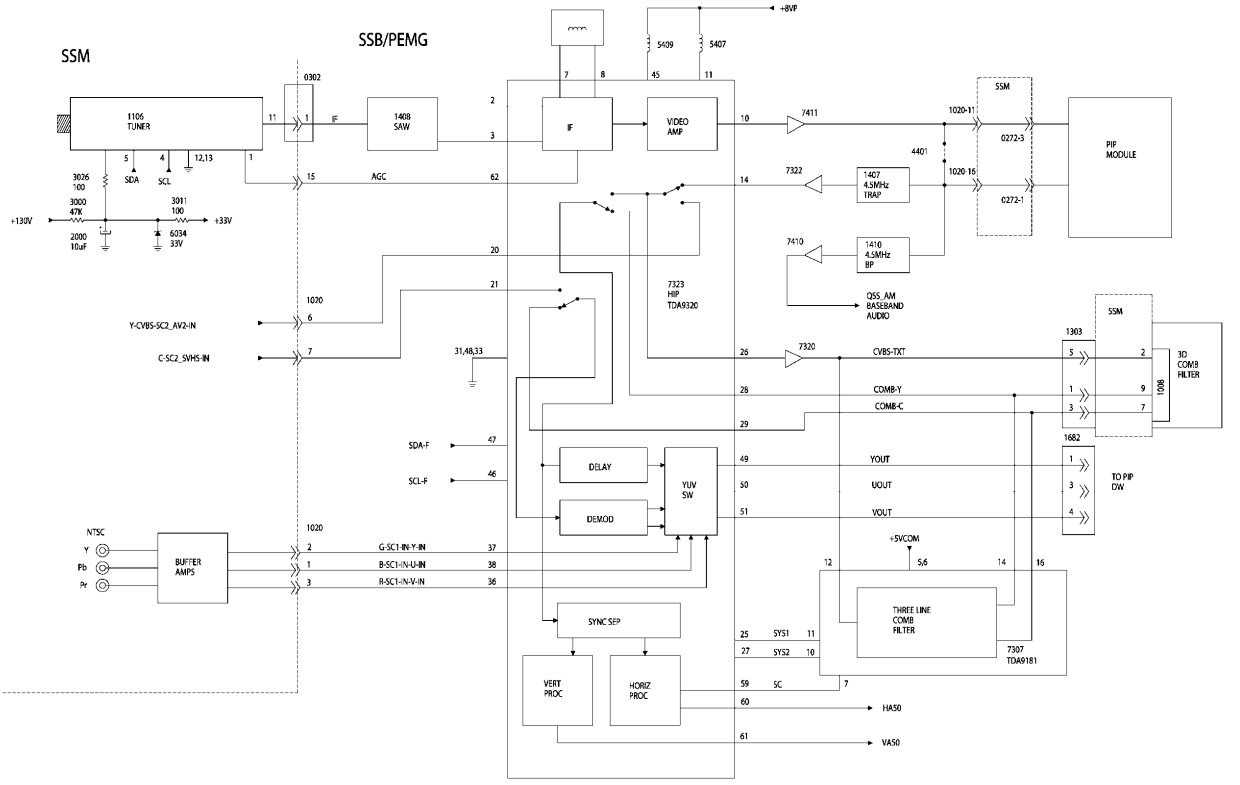


Figure 10

IC 7017 located on the SSM performs the Video and Audio switching for the Composite inputs to the SSM. Selected Y or Composite video is output on Pin 1 before being fed to the SSB. Selected C is output on Pin 3 and is fed to the SSB. Selected Composite Video for the PIP window is output on Pin 39 and fed to the PIP panel. If an SVHS source is selected for the PIP window, the YC is combined in 7017 and output on Pin 39. IC 7017 is controlled by the Microprocessor via the I2C SDA and SCL lines on Pins 33 and 32.

SSB Video Switching

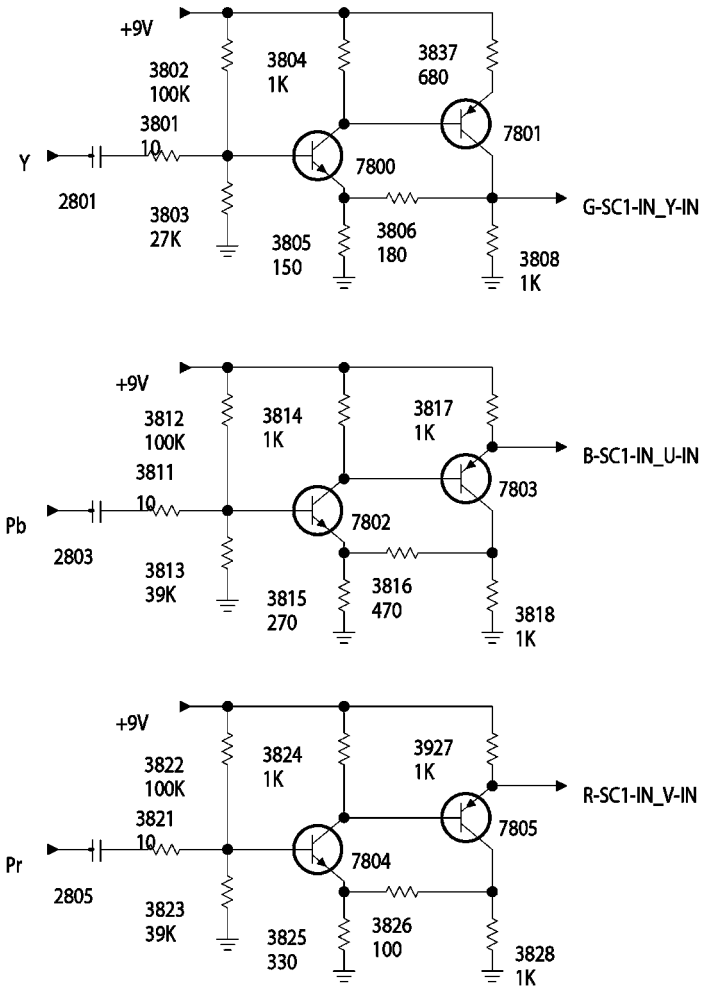

Figure 11

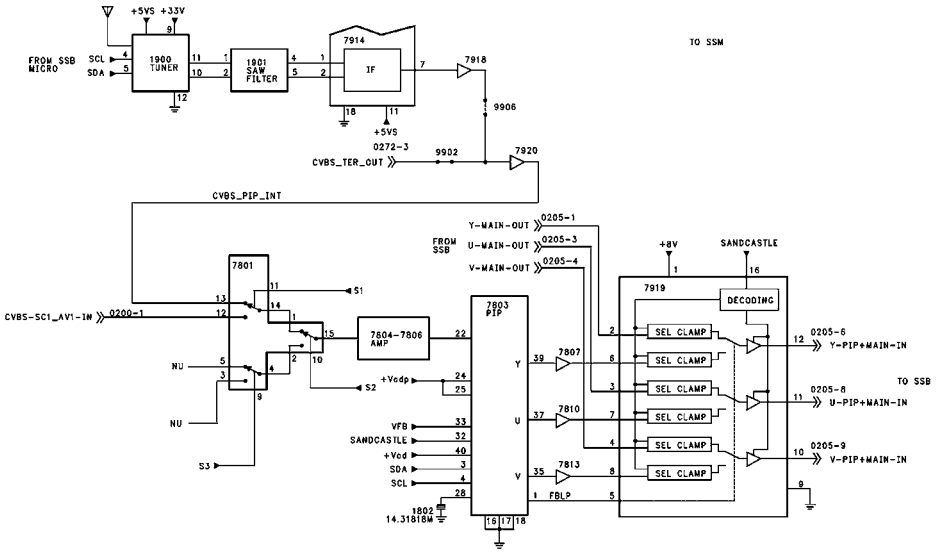
Selected Composite video from the SSM is fed to HIP 7323 located on the SSB. IF from the main Tuner located on the SSM is fed to the SSB via connector 0302 to the SAW filter 1408 and to Pin 2 and 3 of 7323. Composite Video is output on Pin 10 and is buffered by 7411 before being fed to the PIP panel via the SSM in the Basic version only. In the two tuner versions, Basic+ and Core, the tuner on the PIP panel tunes to the channel selected by the user for the PIP window. There is no second Tuner in the Basic version. Video for the main picture is fed through 4401 to 1407. Composite video from 1407 is fed to transistor 7322 and to Pin 14 of 7323 to an internal switch, which selects between the Tuner video and selected Composite video or Y. If it is a YC signal, the Y signal is internally selected and fed to a Delay and YUV switch. Chroma or C is fed to Pin 21 and is fed to the Demodulator and to the YUV switch. Selected Composite video is output on Pin 26 and is buffered by 7320. In the Basic version, the Composite video is fed to 7307, a three-line Comb Filter, for YC separation. In the Basic + and Core versions, the Composite video is fed to a 3D Comb filter located on a separate panel. YC is then fed back to the HIP on Pins 28 and 29. The YUV switch selects between the YUV from the internal decoder or YUV from the Y Pb Pr inputs located on the SSM. The Microprocessor located on the SSB via the I2C buss, SDA-F and SCL-F, controls the HIP, 7323. The Y Pb Pr signals for NTSC are fed through buffer amplifiers on the SSM before being fed to the SSB. The selected YUV signal is output on Pins 49, 50, and 51 to the PIP/DW circuit via connector 1682.

NTSC Component Buffer Amplifiers

Figure 12



The Y signal is buffered by transistors 7800 and 7801. This is an impedance matching circuit. This circuit does not invert the signal. The Pb signal is amplified by 7802 and buffered by 7803. The Pr signal is amplified by 7804 and buffered by 7805. The Pb and Pr signals are inverted.

PIP

There are two different PIP versions in the HDR2002. The Basic and Basic Plus versions use a Standard Single window PIP. The Core Versions have a Double Window PIP that is capable of showing a Standard PIP, small window, or a double window, split screen.

Standard PIP Signal Flow

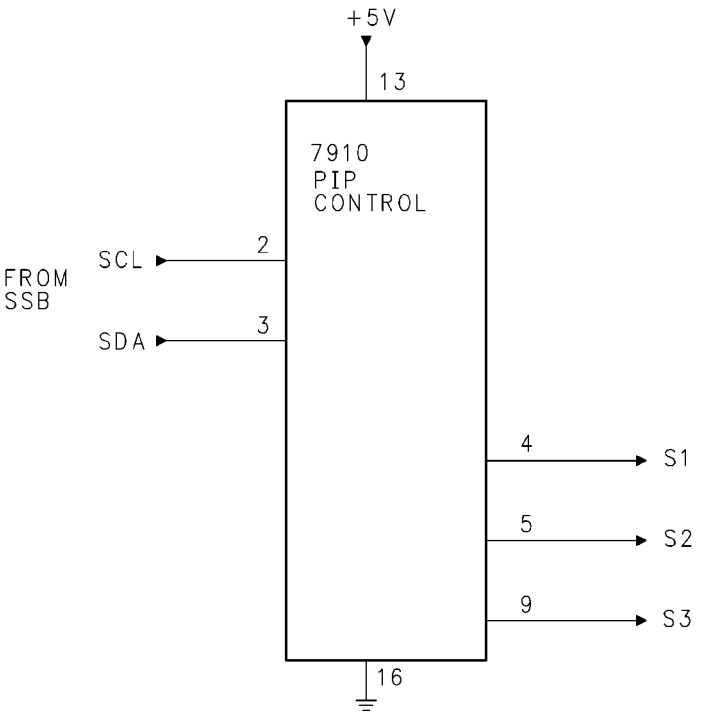


Figure 13

The Standard PIP comes in two versions: Single-Tuner with no tuner on the PIP panel and two- tuner versions with the second tuner located on the PIP module. Output of the second tuner is fed to the SAW FILTER 1901, and to the Signal Processor 7914. Composite Video is output on Pin 7 and buffered by transistor 7918. If the set has two-tuners, the video is output through jumper 9906 to buffer transistor 7920. If the set is a single-tuner version, video from the SSB is fed to 7920 via jumper 9902. Video is then fed to 7801, which selects between the output of 7916 or from selected composite video from the SSM. The output of 7801 is buffered by a four-transistor amplifier before being fed to Pin 22 of 7803, PIP processor. The PIP processor is controlled by the I2C buss (SDA and SCL) from the SSB Microprocessor. It is kept in sync by the Vertical sync pulse (VFB) and the Horizontal sync pulse (SANDCASTLE). The PIP window video is output as YUV to the YUV switch, 7919. The signal is combined with the main picture YUV from the SSB panel on connector 0205. The combined YUV signal is output on Pins 12, 11, and 10 to the SSB.

Standard PIP Switching

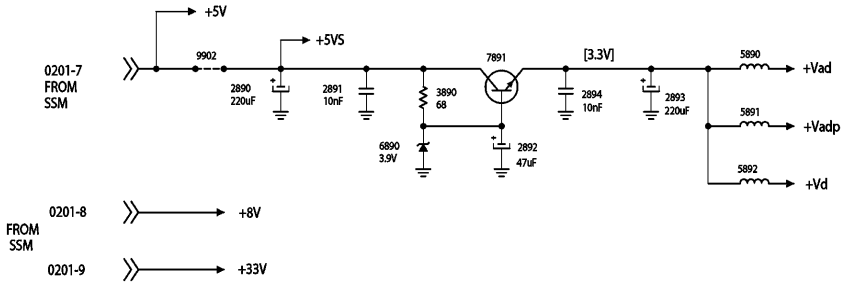

Figure 14

Control for the PIP panel is performed by 7910 via the I2C buss. SEL_TUNER1 and SEL_TUNER2 control the composite switching to the SSB panel. S1, S2, and S3 control the tuner aux switching IC, 7801.

Standard PIP Power Supply

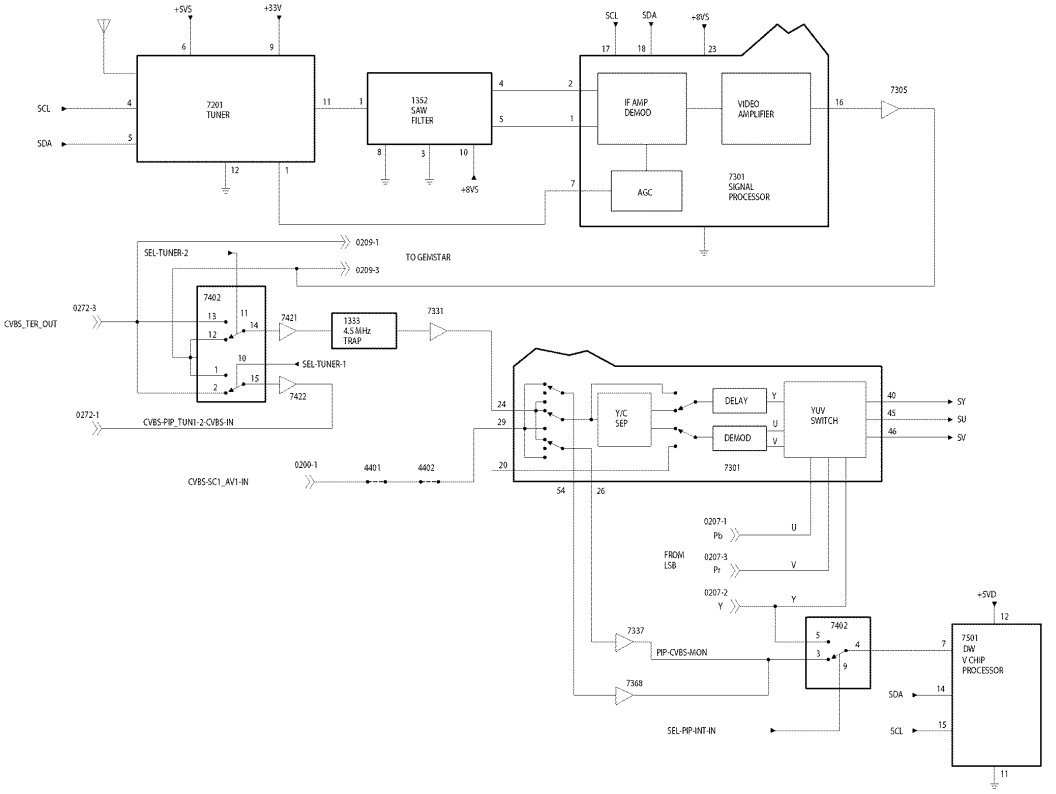

Figure 15

The PIP panel is powered by +5-volt, +8-volt, and +33-volt supplies from the Small Signal Module (SSM). A 3.3-volt regulator supplies power to the PIP processor, 7803.

Double Window PIP

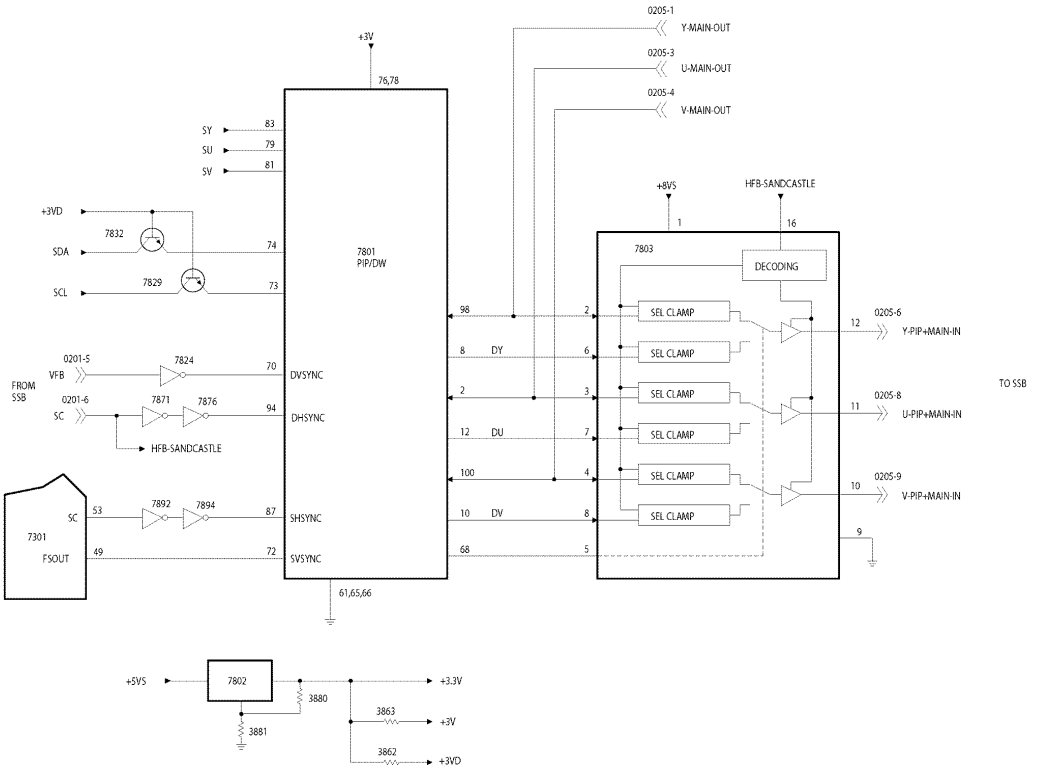

Figure 16

The PIP/Double Window panel allows for both a standard PIP window and a split screen. The PIP/Double Window module has a separate Tuner, SAW filter, and Signal Processor. The output of the Signal Processor, 7301, on Pin 16 is fed to switching IC 7402 which selects between the PIP Tuner and Composite Video from the SSB. Selected Composite Video for the main picture is output on Pin 15 of 7402 and is fed to the SSB. Selected Composite Video for the PIP window is output on Pin 14 and is buffered by 7421. It is fed to 1333, 4.5MHz Trap. It is then buffered by transistor 7331 before being fed to Pin 24, which selects between the selected Tuner Video or selected Composite Video from the SSM. Composite Video is fed to a YC separator, then to a Delay Line and Demodulator. If it is a YC signal, it bypasses the YC separator. The YUV signal is then fed to the YUV switch, which selects between the output of the Delay Line and Demodulator, and external YUV from the Large Signal Board. The YUV (SY, SU, and SV) is output to the PIP processor IC. Selected Composite Video is fed to the V-Chip processor. V-Chip processing for the main picture is done by the Microprocessor on the SSB.

Double Window Output

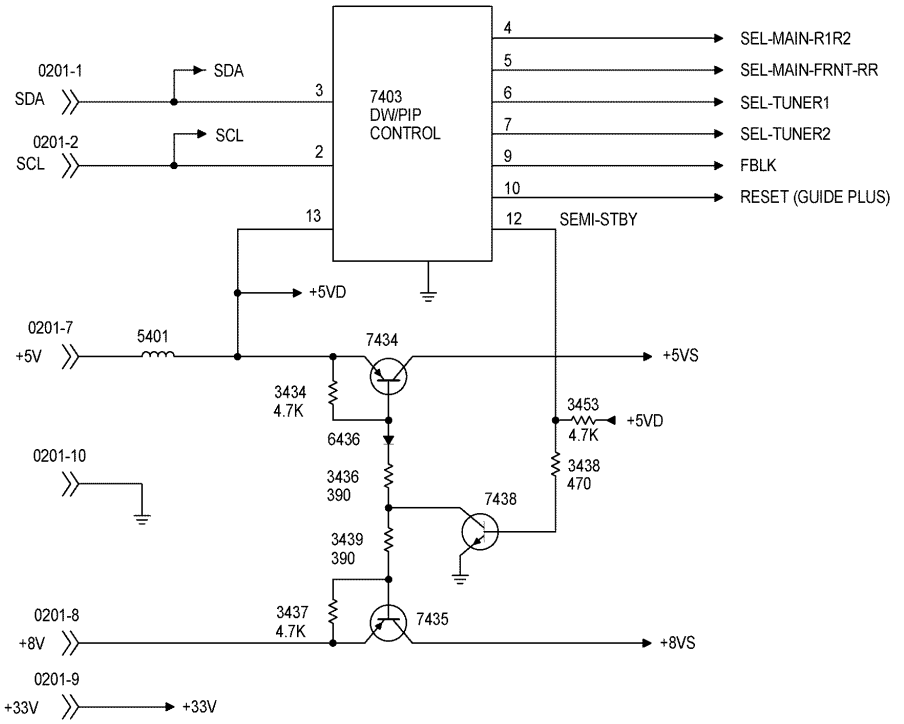

Figure 17

The PIP or Double Window YUV signal is fed to the PIP/DW processor, 7801. The I2C buss controls the IC from the Microprocessor on the SSB. The PIP/DW processor outputs YUV for the PIP window or Split Screen to the YUV switch,7803, where it is mixed with the YUV signal from the SSB for the main picture. The Fast Blanking line from 7801 on Pin 68 controls the switch point in which the PIP window or Split Screen is inserted. The +3VD line switches the SDA and SCL lines. The PIP processor is powered by the +3-volt supply. The +3.3-volt, +3-volt, and +3VD-volt supplies are produced by the regulator 7802, which is driven by the +5VS supply. This supply is switched On when the PIP window is selected.

Double Window Control and Power Supply

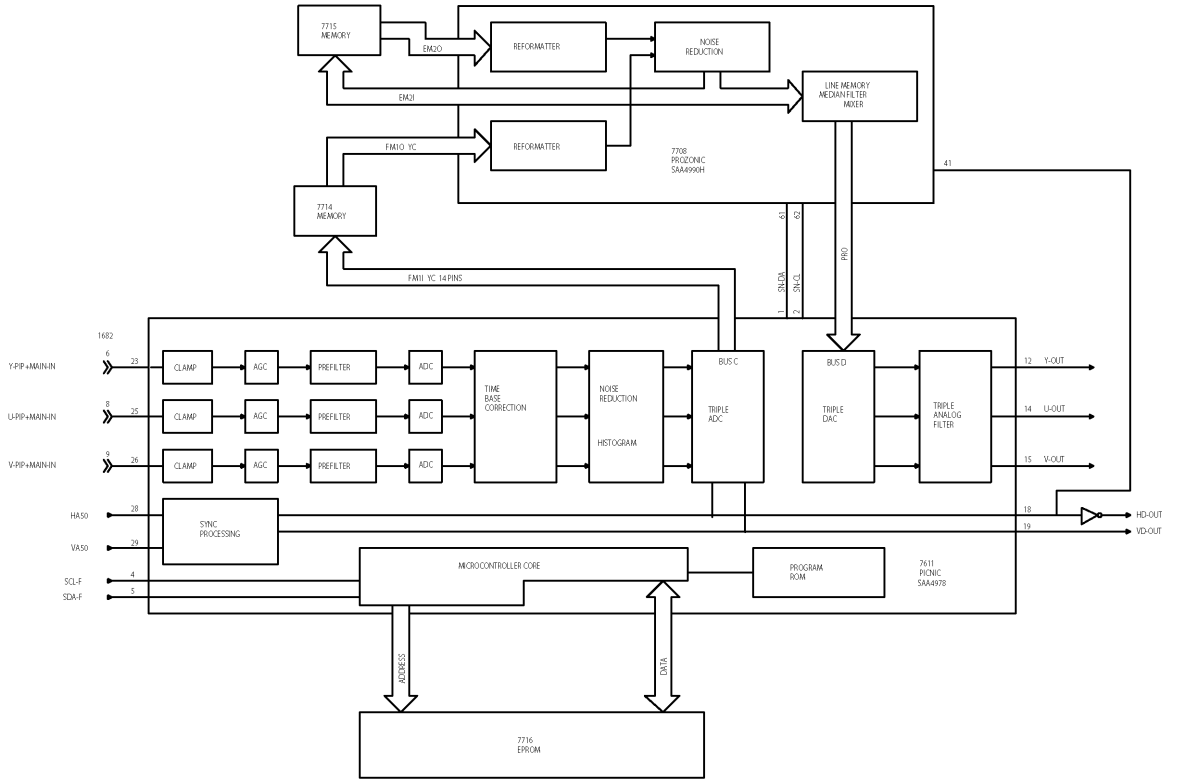

Figure 18

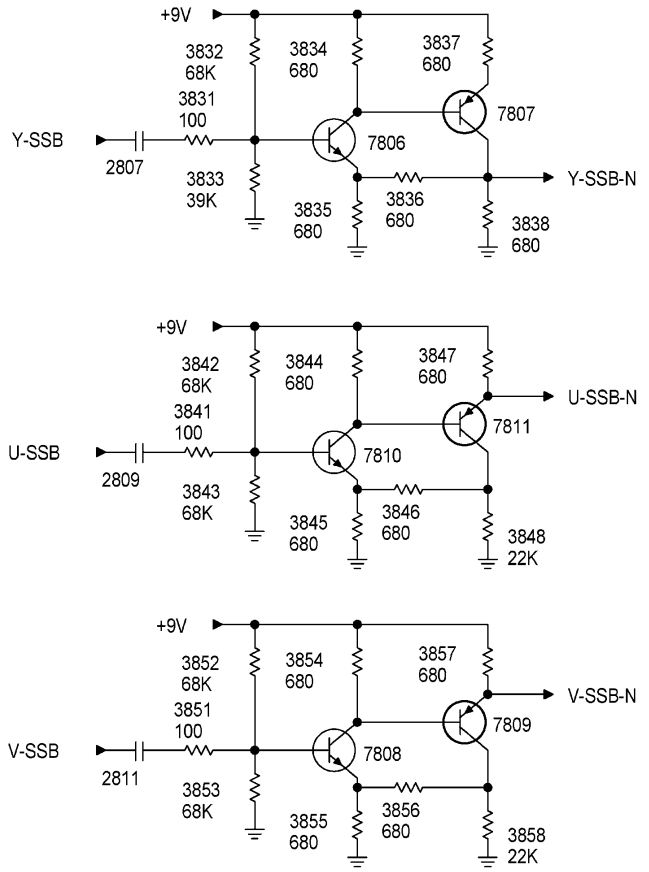
The PIP/Double Window module is controlled by the I2C buss through 7403 on the PIP module. Pins 4, 5, 6, and 7 perform Video selection functions. Pin 10 produces a reset signal for the Guide Plus module. Pin 12 controls the +5VS and +8VS supplies.

Feature Box

Figure 19

The YUV signal from the PIP module is fed back to the SSB on connector 1682, Pins 6, 8, and 9. This circuit is called the Feature Box. The Feature Box changes the picture from a 15734 Hz NTSC interlaced signal to a 480P progressive scan signal at 31468 Hz. The refresh rate or vertical stays 59.94 Hz.



The signal is fed to 7611 on Pins 23, 25, and 26. This IC is called the PICNIC (Picture Improvement Network IC). The Clamping circuit sets the reference level for the black level of the YUV signal. The Prefilter circuit limits the higher frequencies to prevent aliasing to low frequencies. The signal is then fed to a triple Analog to Digital Converter, ADC. The digital signal is then fed to a Time Base Corrector, a Noise Reduction and Histogram, and to a Multiplexer. The YC/UVC signal is then fed to the Field Memory IC, 7714. The PROZONIC IC, 7708, then reads the data from 7714. The PICNIC communicates with the Microprocessor via the I2C buss via the SCL-F and SDA-F lines connected to Pins 4 and 5. The PICNIC communicates with the PROZONIC via the SN-DA and SN-CL lines. The EEPROM, 7716, stores operational data for the Microprocessor in the PICNIC.

The PROZONIC (Progressive Scan-Zoom and Noise) IC converts to a digital signal from the PICNIC, which is a 15734 NTSC digital signal to a Progressive Scan digital signal at 31468 Hz. ICs 7714 and 7715 are Memory ICs, which store the video fields as they are being processed by 7708. The two fields are recombined in the Line Memory inside 7708. The digital 480P signal is then output to a triple DAC (Digital-to-Analog Converter) in IC 7611. The analog signal is then filtered and then output as YUV on Pins 12, 14, and 15.

Horizontal and Vertical sync is output on Pins 18 and 19. The output on Pins 12, 14, and 15 is a 480P analog signal.

SSM HOP Buffer Amplifiers

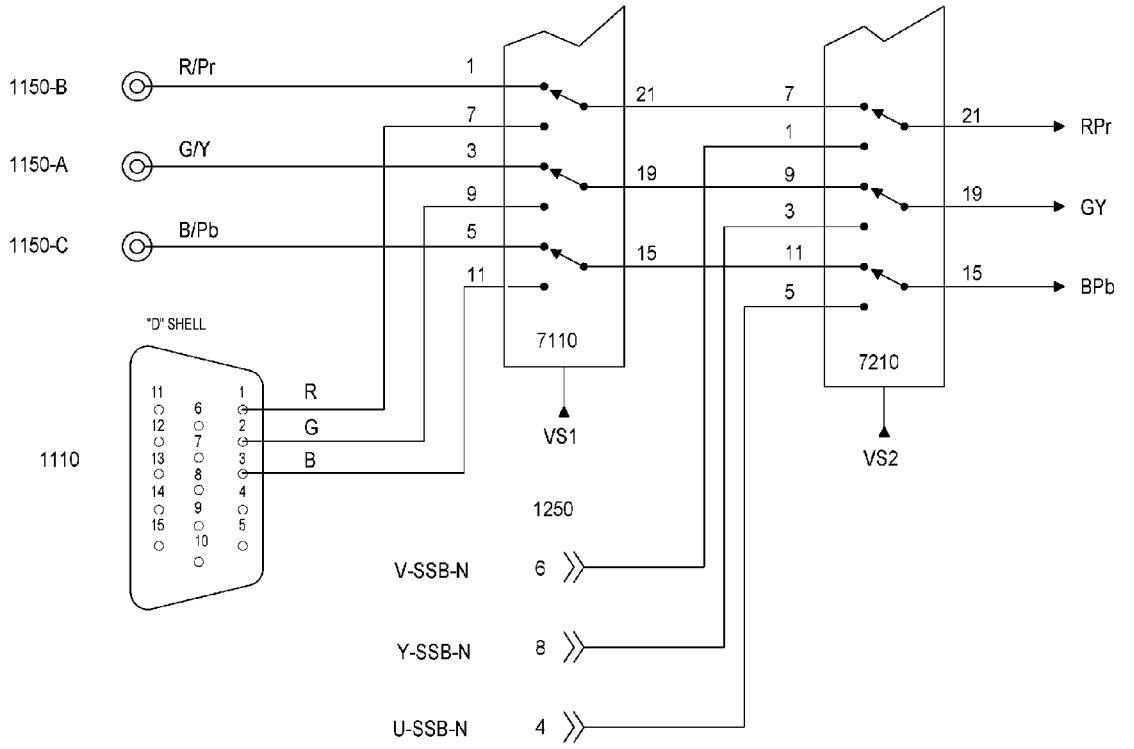


Figure 20

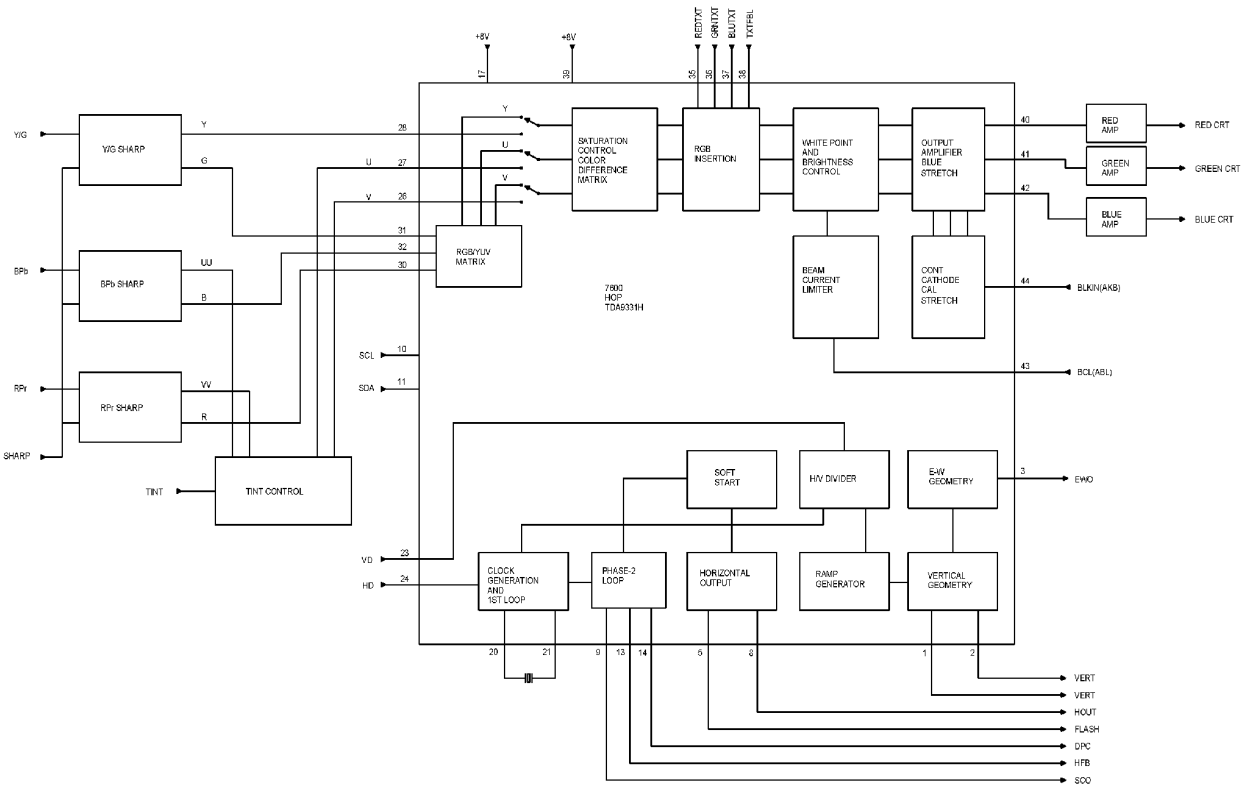
The Y-SSB, U-SSB, and V-SSB signals are fed to buffer amplifiers located on the SSM. Transistors 7806 and 7807 buffer the Y signal. The U signal is buffered and inverted by transistors 7810 7811. The V signal is buffered and inverted by transistors 7808 and 7809. The YUV signals are then fed to the HOP panel via connector 1250.

HOP RGB/YUV Switching

Figure 21



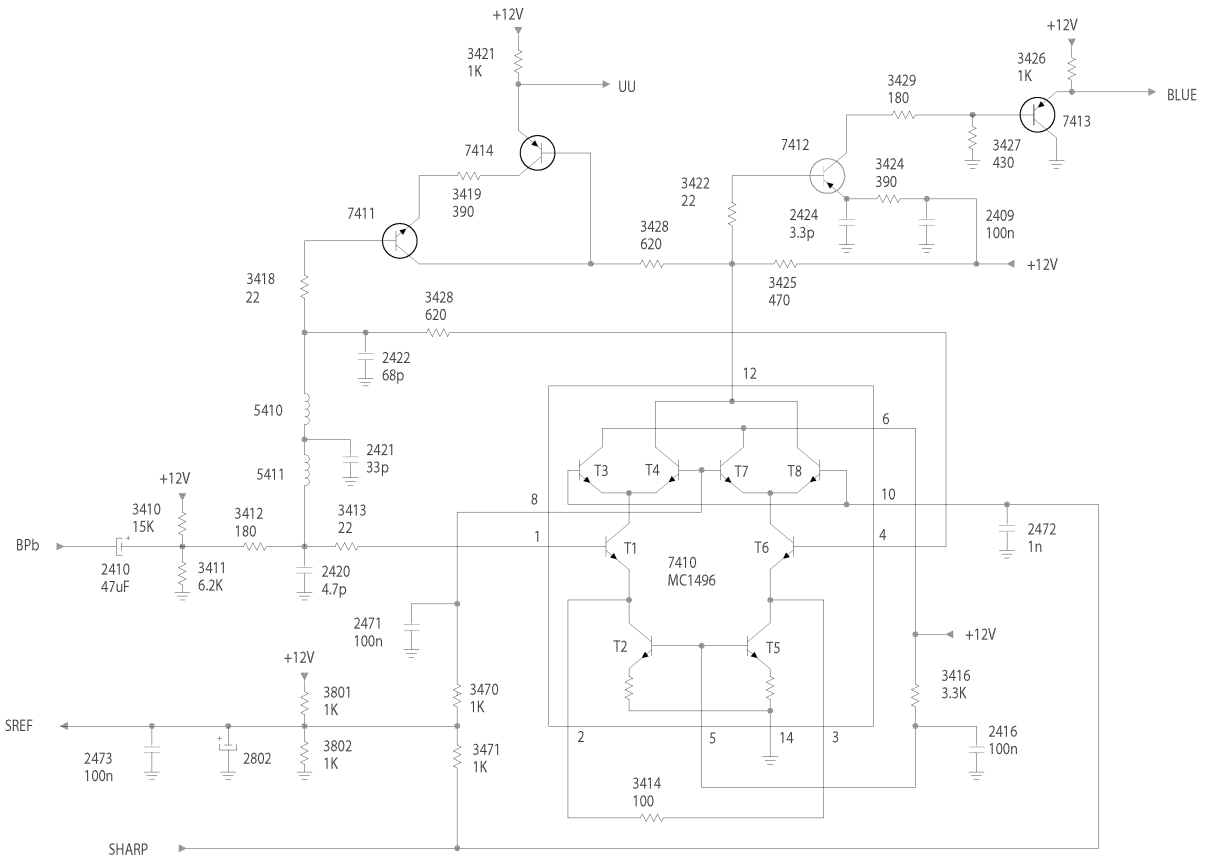
The input to the HOP panel can be RGB or Y Pb Pr via the cinch connectors or the D Shell connector. The D Shell connector is not present in the Basic or Basic Plus versions. The RGB or Y Pb Pr signal can be either 480P progressive scan or 1080I.

IC 7110 selects between the R/Pr G/Y B/Pb or the RGB signal from the D Shell connector. The output of 7110 is fed to 7210, which selects between the output of 7110 or the YUV signal from the SSM.

HOP Signal Processing

Figure 22

The Y/G, B/Pb, and R/Pr signals are fed to their respective sharpness controls. If the input is a YUV signal, the Y signal is fed to Pin 28 of 7600. The U and V signals are fed to the Tint Control circuit and then to Pins 27 and 26 of 7600. If the input is RGB, the signals are fed to Pins 31, 32, and 30 of 7600 to an RGB to YUV converter. When RGB input is used, there is no Tint control available for the signal.



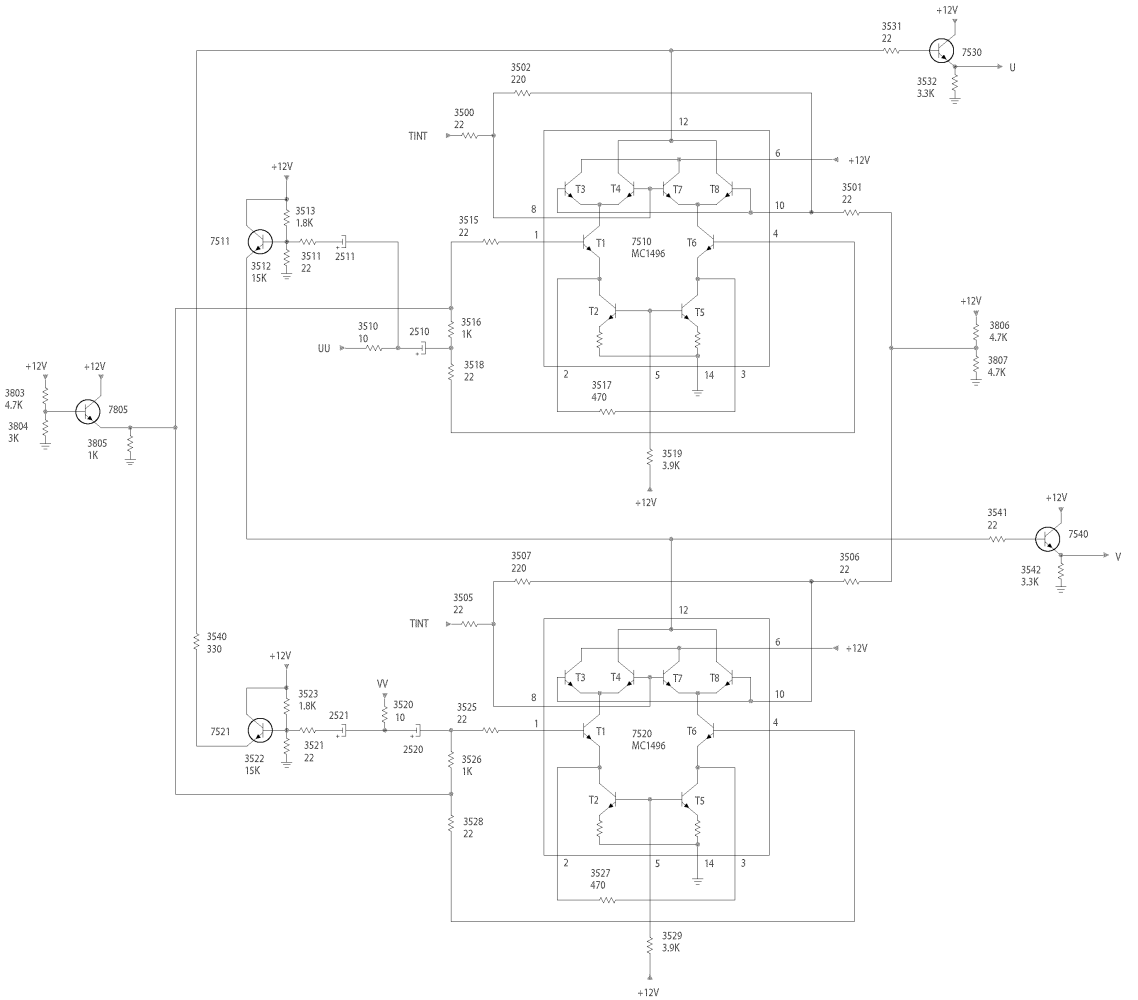
The input selector switch in 7600 selects between the YUV on Pins 28, 27, and 26 or the output of the internal RGB/YUV converter. The signal is fed to the RGB insertion circuits where the OSD is inserted. The signal is then fed to a White Point circuit and then to the Output Amplifier. The White Point and Output Amplifier has the Drive controls and Cutoff controls. Input from the ABL line on Pins 43 makes adjustments in the brightness levels to adjust for changes in beam current. The AKB pulses from the CRTs are fed to Pin 44 to the Cathode Calibration circuit. The Cathode Calibration circuit adjusts the cutoff levels of the CRTs to maintain the correct gray scale tracking. When the set is first turned On, a calibration pulse is output on the RGB lines. The Cathode Calibration circuit monitors this pulse on the AKB line to set the Black level and the maximum drive voltage for the cathode. Once the Calibration has taken place, the Output Amplifier switches to the RGB drive signal as the output.

Horizontal and Vertical Sync is fed to 7600 on Pins 23 and 24. IC 7600 processes the sync to provide the geometry for the picture. Horizontal drive is output to the sweep circuit on Pin 8. Vertical drive is output on Pins 1 and 2. East West drive is output on Pin 3. Sandcastle (SCO) is output on Pin 9. Horizontal Feedback (HFB) from the sweep circuit is fed into the Phase Loop to phase correct the Horizontal drive.

IC 7600 is controlled by the Microprocessor via the I2C buss on Pins 10 and 11. Geometry and Drive settings are stored in the Memory IC located on the HOP panel.

HOP Sharpness Control

Figure 23



The Sharpness controls for the YUV/RGB signals are located on the HOP panel. Since all three circuits are basically the same, only the Blue one will be discussed.

The Blue signal is fed to Pin 1 of 7410. It is also fed to a Low Pass filter consisting of 5411 and 5410. This path is amplified by transistor 7411. The Low Pass filter blocks the Higher frequencies as well as shifting the phase of the signal. The output of the Low Pass filter is also fed to Pin 4 of 7410. The mixing of these two-phase shifted signals only allows the High frequency component to be amplified and output on Pin 12. The gain of the High frequency component is controlled by the Sharpness voltage, which is applied to Pins 8 and 10. The two signals are combined at Pin 12 of the IC. If the input is a Blue signal it is amplified by 7412 and buffered by 7413. If the input is a U signal, it is buffered by 7414.

HOP Tint Control

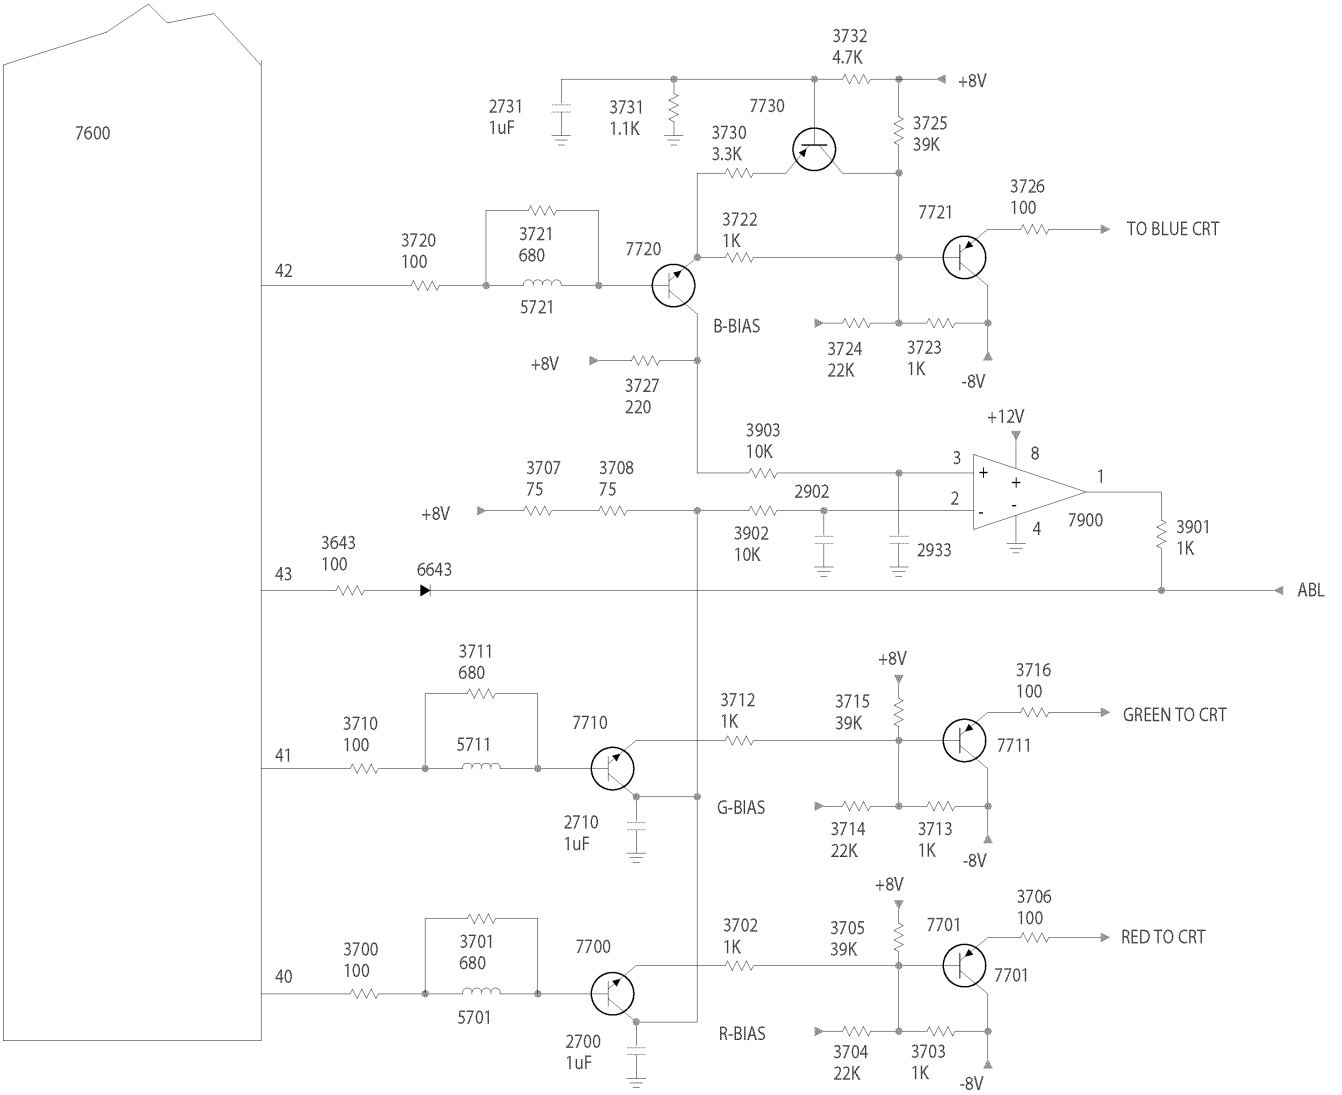


Figure 24

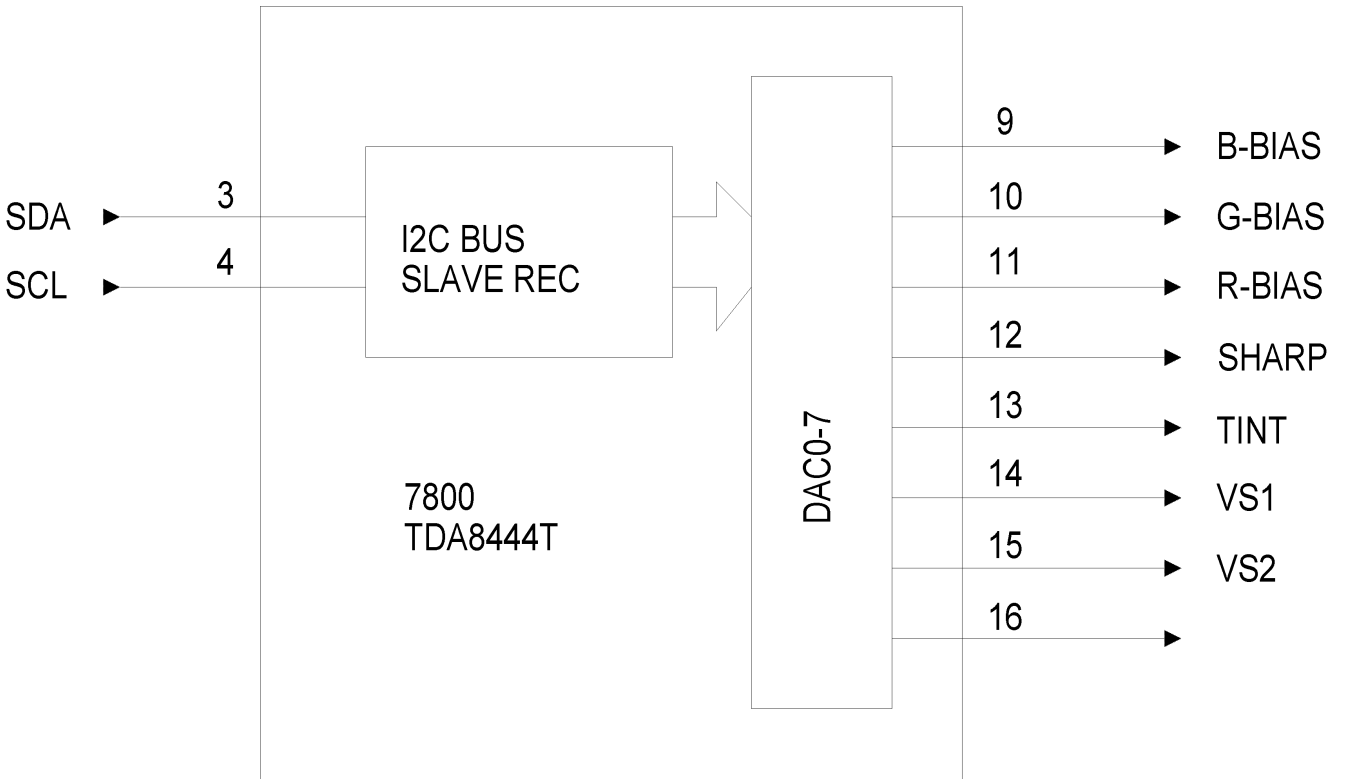
IC 7510 amplifies the U signal while 7520 amplifies the V signal. The Tint control voltage changes the balance between the U and V signals to change causing the tint of the picture to change.

RGB Amplifiers

Figure 25

The output of 7600 is fed to the RGB amplifiers before being fed to the CRTs. Transistors 7720 and 7721 buffer the Blue output on Pin 42. The B-BIAS control voltage controls the gain of this circuit. Transistors 7730 provide an additional voltage gain for the signal.



7710 and 7711 buffers the Green output from Pin 41 of 7600. The G-BIAS controls the gain of the circuit.

The Red output from Pin 40 of 7600 is buffered by 7700 and 7701. The R-BIAS controls the gain of the circuit.

The drive of the Red and Green outputs are compared with the Blue drive by 7900-A. The difference signal is fed back to 7600 via the ABL line. If the Blue CRT is driven harder than the Green and Red CRTs, the inverting input on Pin 2 will become greater than the non-inverting input on Pin 3, resulting in the output on Pin 1 to go Low. The ABL line will go Low, causing 7600 to reduce the drive to all of the CRTs. This circuit prevents the Blue tube from being over driven.

HOP Analog Control

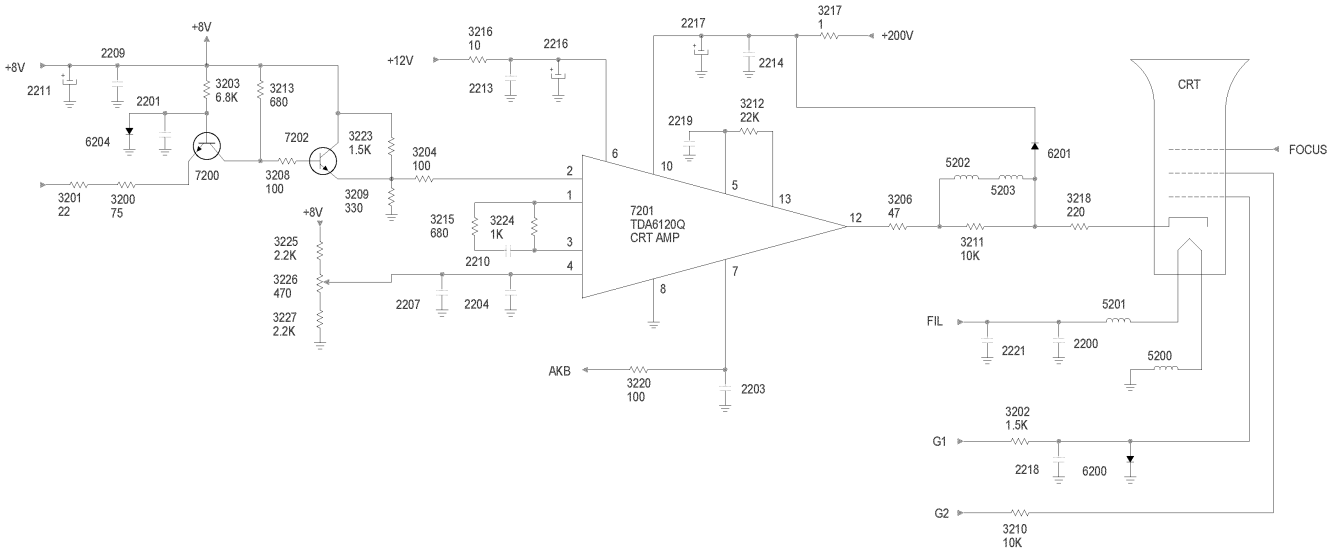


Figure 26

IC 7800 develops the analog control voltage for the HOP panel. The I2C bus controls the IC. This IC is located on the HOP panel. The Microprocessor that controls this IC is located on the ACS module.

CRT Panel

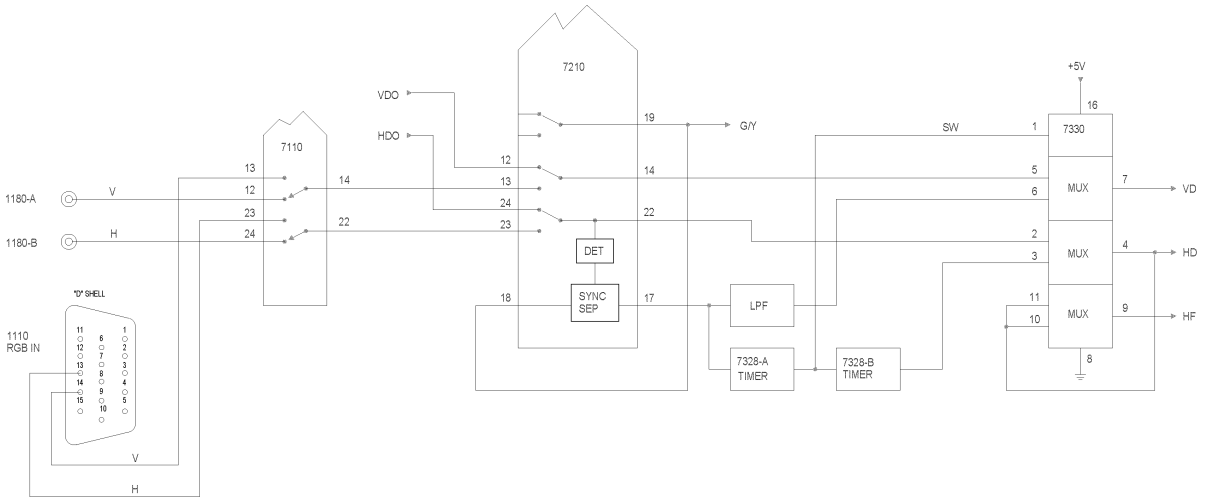

Figure 27

The Red, Green, and Blue signals from the HOP panel are fed to their respective CRT panel. The signal is fed to the emitter of 7200 and then to 7202. The output of 7202 is fed to Pin 2 of 7201, which drives the cathode of the CRT. AKB drive is output on Pin 7 and fed to the HOP panel.

HOP Sync Switching and Processing

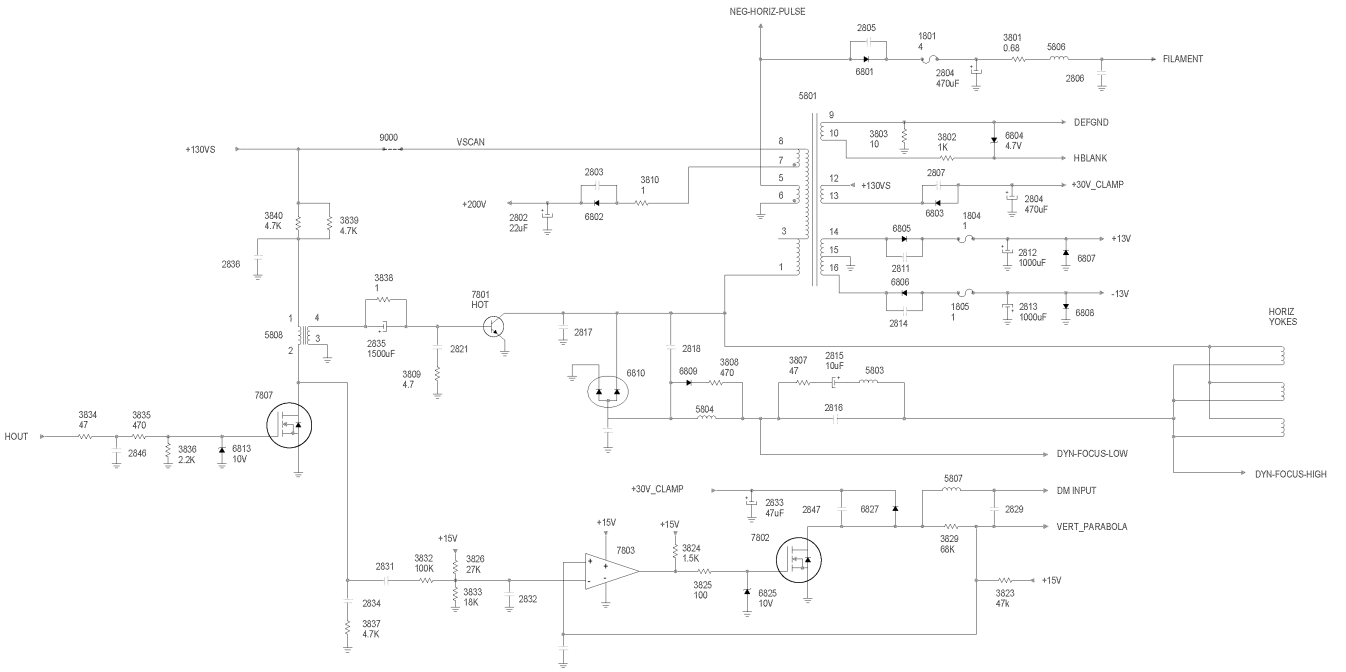

Figure 28

Horizontal and Vertical Sync from the SSB is fed to the HOP panel via the SSM panel when NTSC is used as the signal source. In sets with the D Shell RGB input, 7110 switches between the Vertical and Horizontal Sync on the cinch connectors or the Sync from Pins 13 and 14 of the D Shell connector. IC 7210 selects between the output of 7110 and the Sync from the SSB. For separate Horizontal and Vertical Sync, the output of 7210 is fed to the multiplexer IC 7330, which is used as a switch. In the case of Sync on Y or Sync on Green, Pin 19 of 7210 is fed to Pin 18 of 7210 to a Sync Separator. If separate Horizontal Sync is present, the internal detector in 7210 turns the Sync Separator Off. The Sync output on Pin 17 is fed to a Low Pass Filter, which separates the Vertical Sync. The Timer IC,7328, detects the Horizontal Sync and feeds it to 7330. The detected Horizontal Sync from 7328 is fed to Pin 1 of 7330 to switch the IC to the Pin 6 and 3 inputs.

Horizontal Output

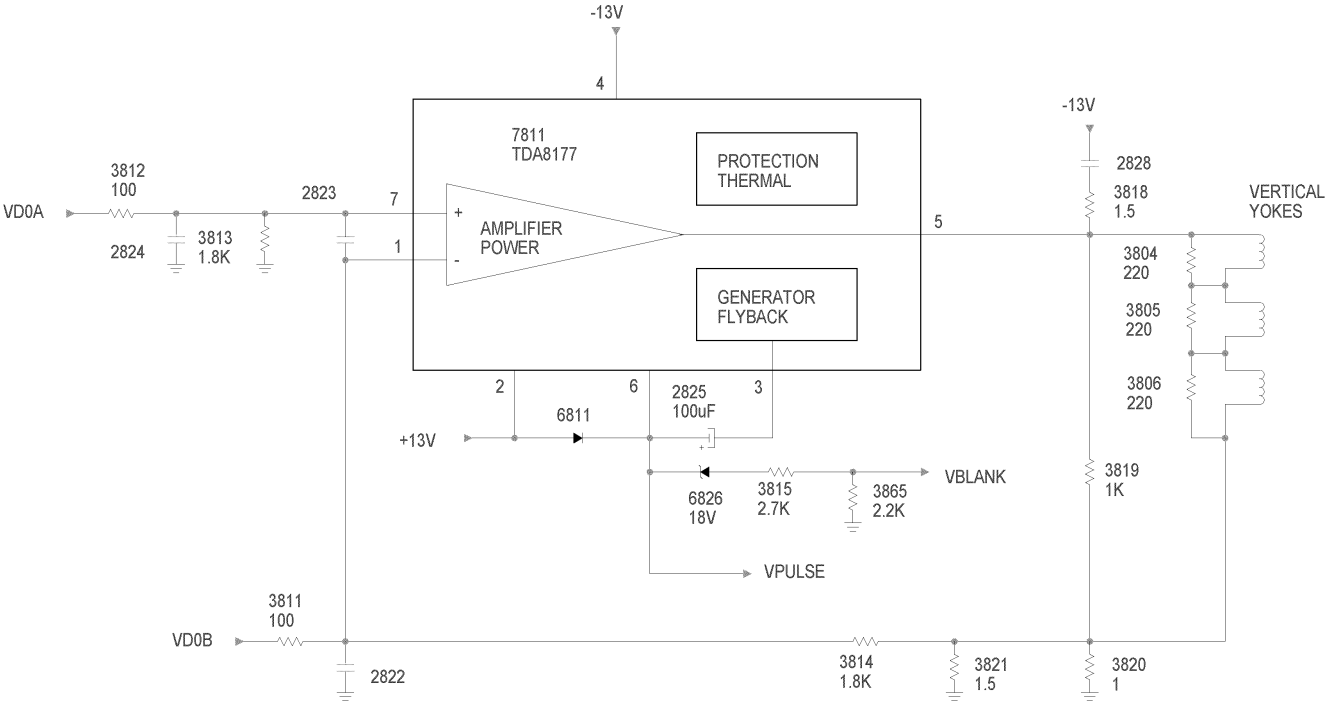

Figure 29

Horizontal drive from the HOP panel is fed to 7807 on the Large Signal panel. Transistor 7807 drives the Horizontal Output Transistor,7801, which drives the Yokes and the Horizontal Output Transformer 5801. Transformer 5801 produces a plus and minus 13-volt supply for the Vertical Output circuit. It also produces a 200-volt source and Filament voltage for the CRT panels. The output of 7807 also drives 7803 and 7802, which drives the Dynamic Focus circuit.

Vertical Output Amplifier

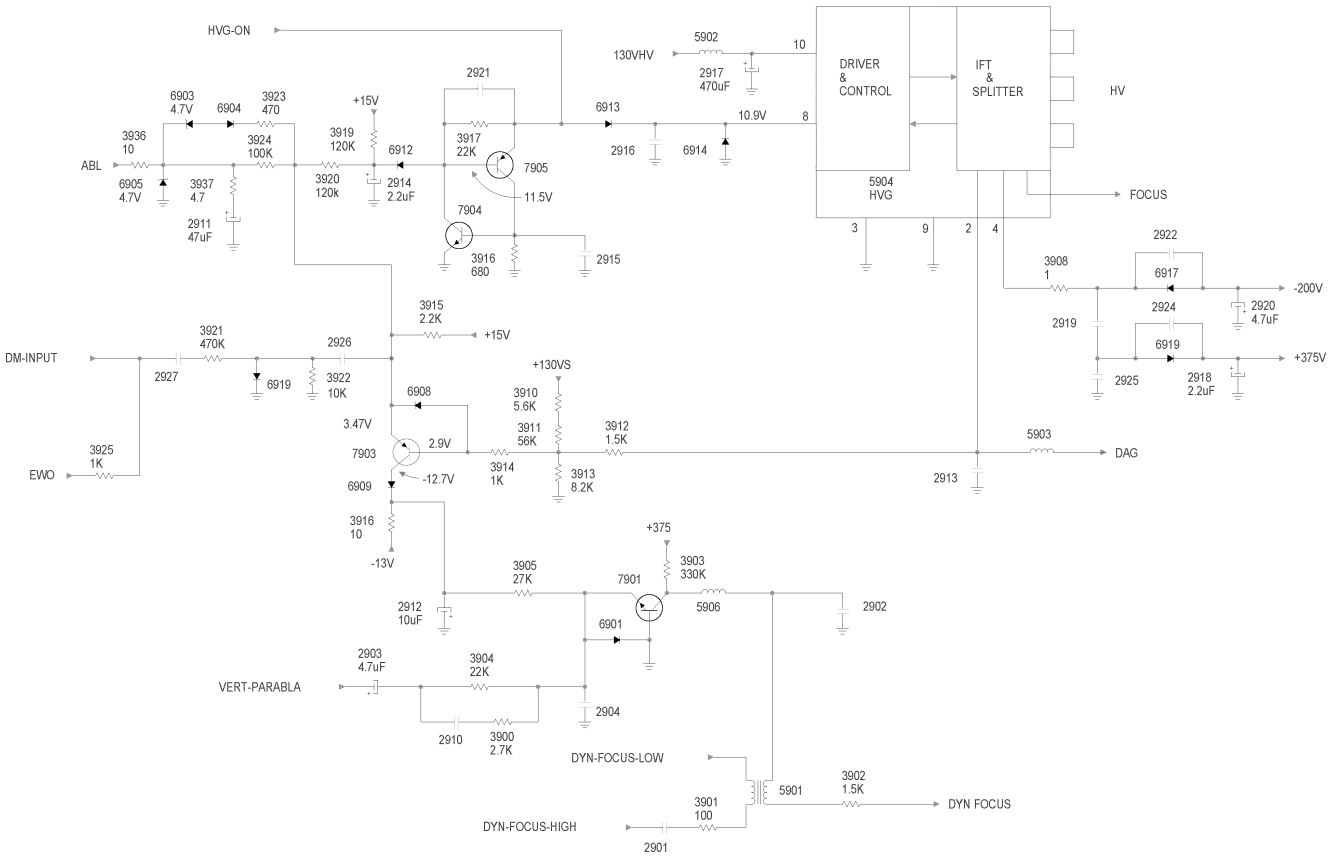

Figure 30

The Vertical drive from the HOP panel drives the Vertical Output IC 7811. This IC is located on the Large Signal panel. Drive is fed to Pin 7 and is output on Pin 5 to drive the three Vertical Yokes. This IC is powered by the plus and minus 13-volt supplies from the Horizontal Output circuit. A Vertical pulse on Pin 6 is fed to the sweep failure detection circuit. If there is a failure in the Horizontal or Vertical sweep, the High Voltage will be shut down.

High Voltage Circuit

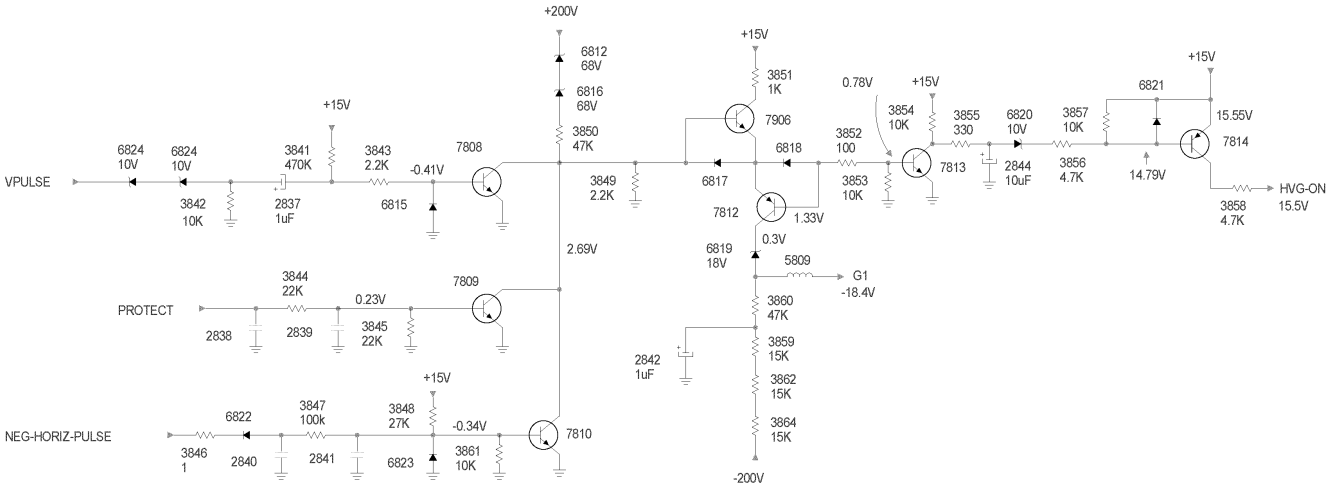

Figure 31

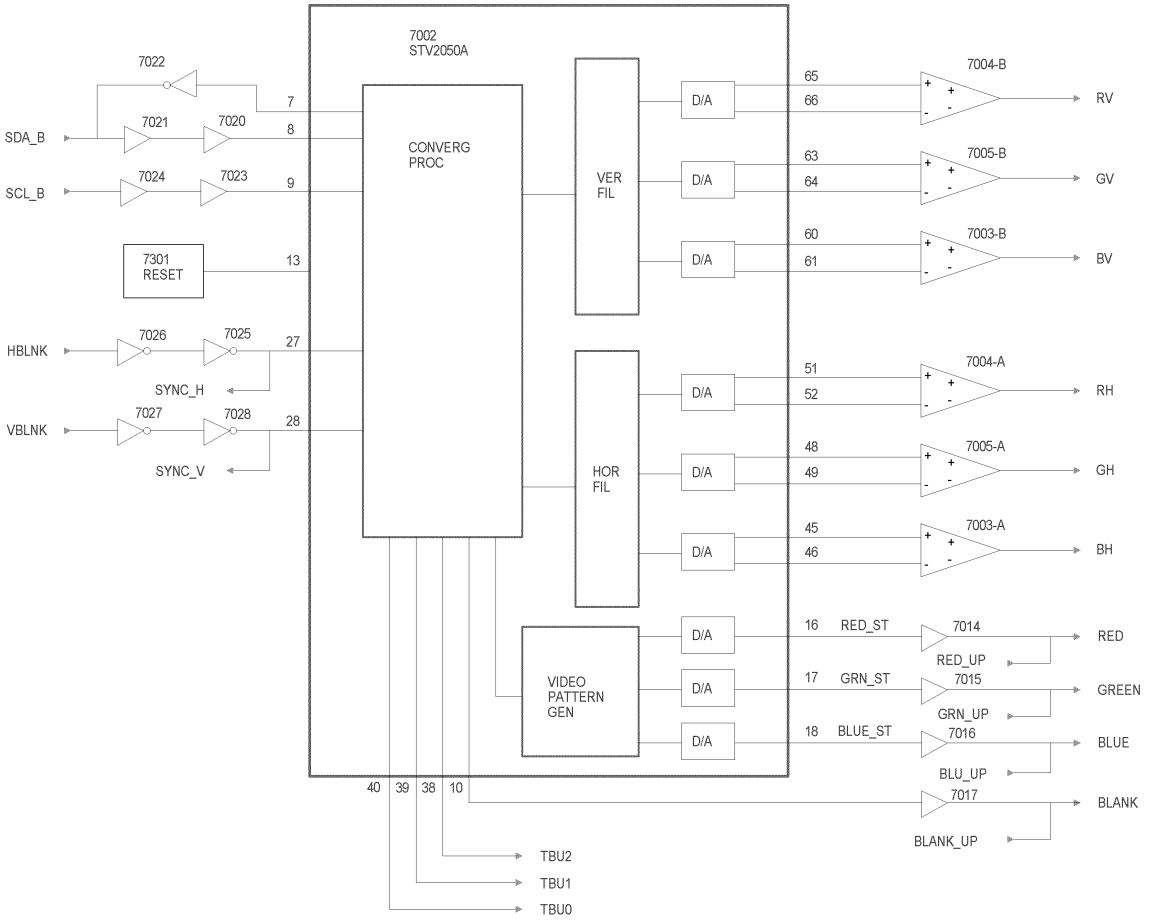
The High Voltage module is an integrated High Voltage supply with its own switching power supply. When the set is turned On, 11.5 volts from the Sweep Failure detection circuit is fed to diode 6913 and to Pin 8 of the High Voltage module. A supply voltage of 130-volts is also fed to Pin 10 of the module. The Module then outputs High voltage to the three CRTs. It also outputs Focus voltage to the Focus G2 block. Output on Pin 4 is rectified by 6917 to produce a negative 200-volt source for the CRT G1 voltage. The voltage is also rectified by 6919 to produce a 375-volt source for the Dynamic Focus drive. The Dag line along with the output on Pin 2 is connected to 7903 to produce the ABL voltage for the set. If an overcurrent condition should develop with the drive, the ABL voltage will go Low, turning 7905 On, latching 7904, which will remove drive to Pin 8 of the HVG. This will cause the High voltage to shut Off. Vertical Parabola drive is fed to 7901 to produce the Vertical component of the Dynamic Focus drive.

High Voltage Shutdown

Figure 32

The Shutdown circuit will shut the High voltage Off if the Horizontal or Vertical Sweep should fail. It will also shut the High voltage Off if the Power Fail line goes High or the +200-volt source should fail.



The Vertical pulse is fed to zener diodes 6824 and 6814, which keeps capacitor 2837 charged. This pulse is rectified by 6815 to keep the base of 7808 at a negative voltage. This keeps the transistor turned Off. In the same manner, the Negative Horizontal pulses keep the base of 7810 at a negative voltage to keep it turned Off. The Protect line is normally Low, keeping 7809 turned Off. The +200-volt source is fed through zener diodes 6812 and 6816, resistor 3850, the base-emitter of 7906, and the base emitter of 7812 to keep transistor 7813 turned On. This turns transistor 7814 On, which switches the On voltage to the High Voltage module. The conduction of 7812 keeps the voltage on the G1 line at approximately -18-volts, which turns the CRTs On. If the Vertical Pulse should fail, transistor 7808 will turn On, which will turn 7906, 7812, 7813, and 7814 Off. This will turn the HVG module Off. In addition when 7812 turns Off, the G1 voltage will go to a -200 volts, blanking the CRTs. The same sequence will occur if Horizontal should fail, the Protect line should go High, or the +200-volt source should fail.

Convergence

The Convergence system is split into two sections. The convergence signal processor is located on the ACS (Auto Convergence System) module. The output amplifiers are located on the SSM.

Convergence Processor

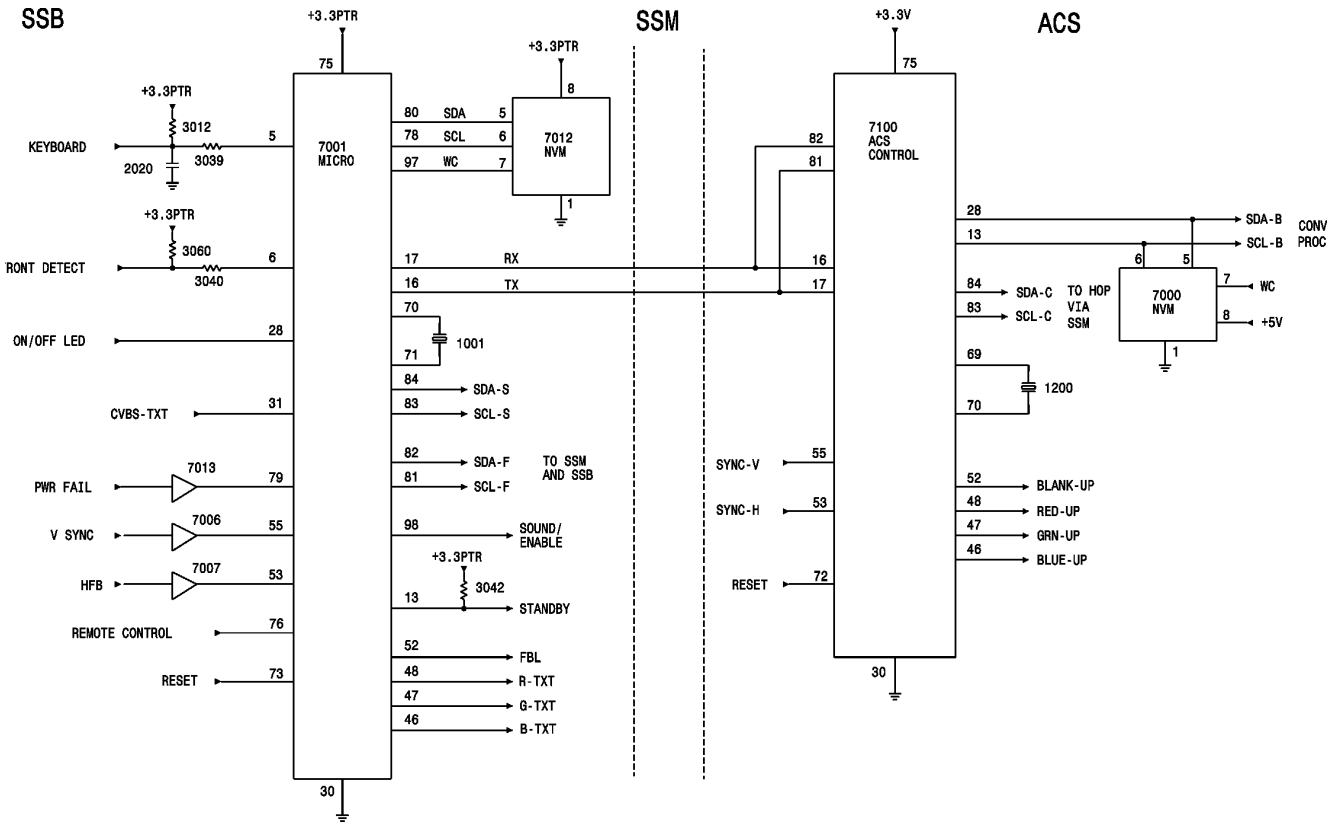


Figure 33

The Convergence data is stored in the EEPROM, 7000. The Microprocessor located on the ASC module reads 1,971 bytes of data from 7000 and writes it to the Convergence Processor, 7002. Horizontal sync is inverted by 7026, buffered by 7025, and fed to Pin 27 of 7002. Vertical sync is inverted by 7027, buffered by 7028, and fed to Pin 28 of 7002. The data is processed to produce the desired convergence correction waveforms which are output on six DACS. During the convergence adjustment procedure, a 180 point alignment grid is output on Pins 16, 17, and 18. This signal is mixed with the OSD to be displayed on the screen. In the 4x3 aspect ratio set, there are three sets of convergence data. In sets with a 16x9 aspect ratio, there are two sets of convergence data. The set will require convergence alignment for each set of convergence data. The correct mode must be selected and the signal for that mode must be applied to the set during the convergence alignment. The output of the DACS is fed to six op-amps before being fed to the Power Amplifiers located on the SSM. When screen centering is being performed, it is necessary to disable the convergence drive waveform. A High on Pin 77 turns transistor 7029 On, turning 7038 On, which turns transistors 7032, 7033, 7030, 7031, 7034, and 7035 On. This mutes the correction drive signal to the Power Amplifiers.

Intellisense Convergence Correction

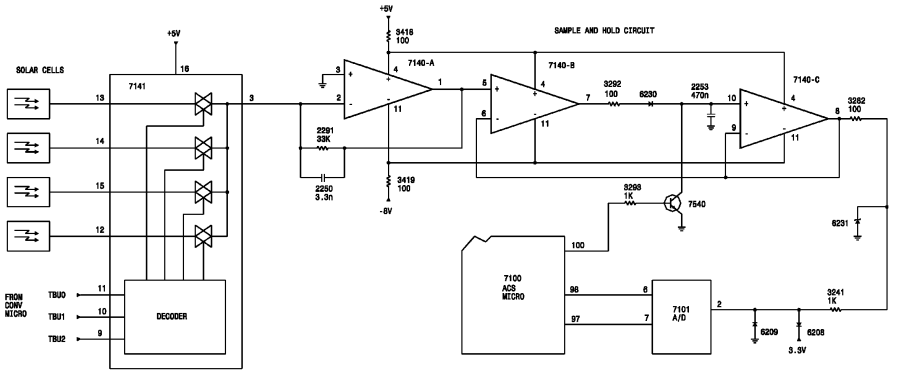

Figure 34

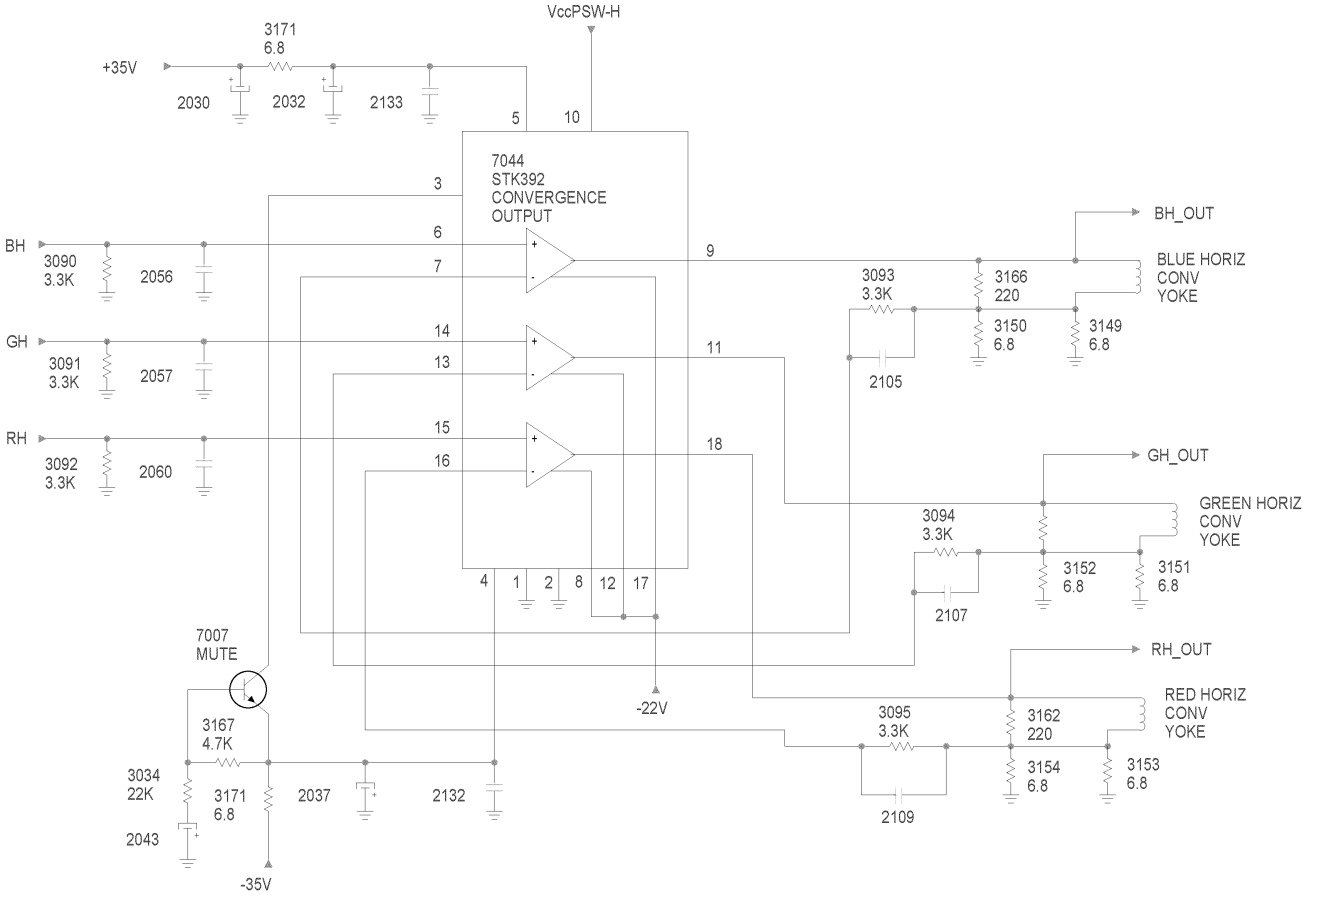
The Philips Intellisense system makes minor Convergence corrections when the feature is selected by the Customer. When a PTV is moved from one location to another, minor Convergence errors will occur due to changes in the Earths magnetic field. When Save is selected during the Convergence Alignment, the set scans four optical sensors with each of the three colors. The locations of these sensors are recorded by the ACS Microprocessor. When the Customer selects the Intellisense feature, the sensors are again scanned and the rotation of the beams for each color is adjusted to the recorded values.

Intellisense Sensing Circuit

Figure 35

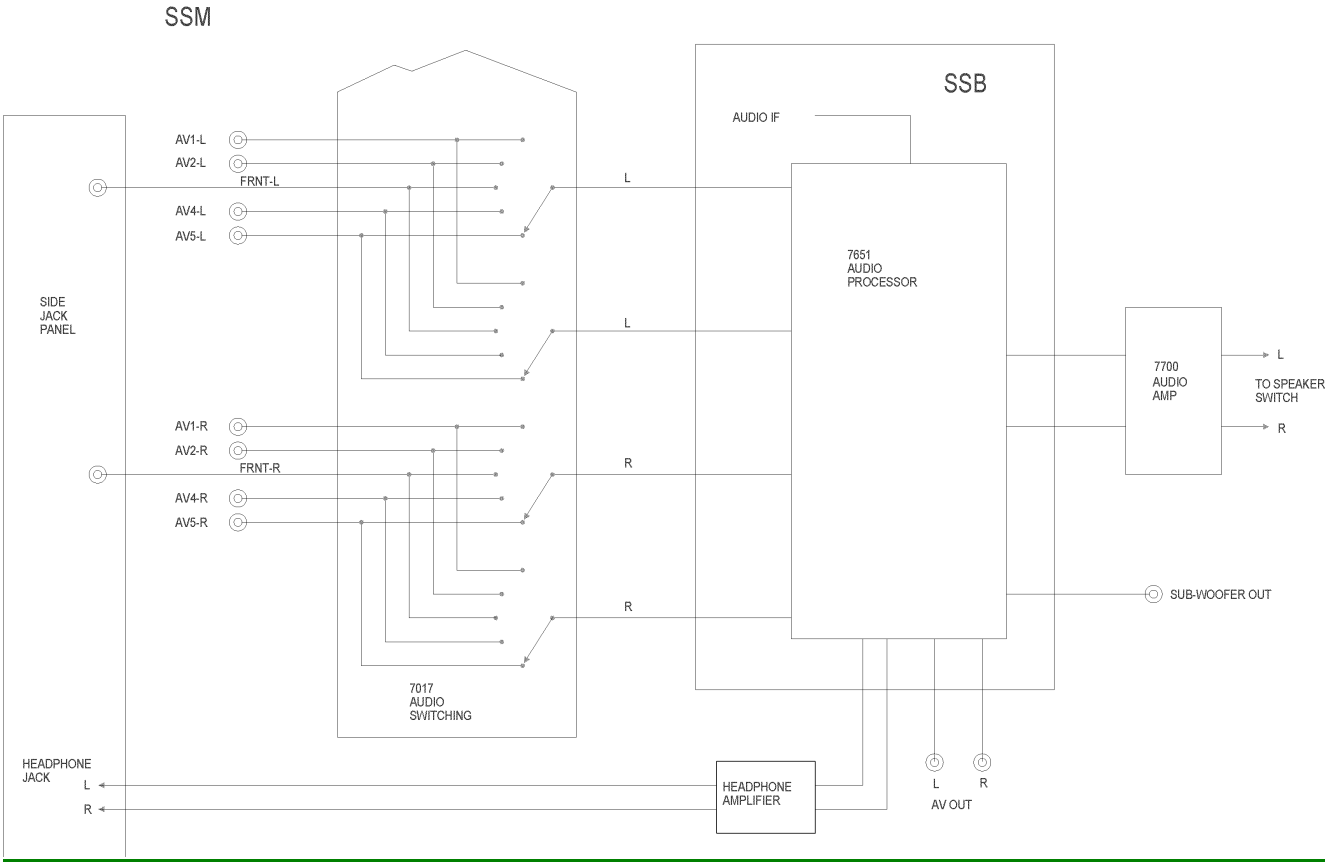


The output of the four sensing Solar Cells are fed to IC 7141 located on the ACS module. Inputs TBU0, TBU1, and TBU2 from the Convergence Microprocessor are fed to the Decoder which selects the Solar Cell to be read. The output on Pin 3 is fed to Pin 2 of 7140-A. 7140-A matches the low impedance output of 7141 to the high impedance input of 7140-B. Amplifier 7140-B charges capacitor 2253 with the sample voltage. Due to the high input impedance of 7140-C, 2253 will hold the sample voltage until it is cleared by transistor 7540. The output of 7140-C is fed to 7101 which is an Analog to Digital converter. The Digital reference voltage is fed to the ACS microprocessor where the data is processed and recorded. When the next location requires sampling, a High is output on Pin 100 of 7100. This turns Transistor 7540 On discharging capacitor 2253.

The Basic version of the HDRPTV does not have the Sensors installed in the set. However, the Sensor Test is in the Service Convergence menu. When the Convergence alignments are stored, the Microprocessor will attempt to read the Sensors. If the Sensor test is selected in the Convergence Alignment menu, the message will read “Sensors not verified at locations: 1234.” This will not affect the Convergence alignments.

Convergence Horizontal Output

Figure 36



IC 7044 amplifies the Horizontal convergence waveforms. The correction waveforms are fed to the IC on Pins 6, 14, and 15. They are output to the Convergence Yokes on Pins 9, 11, and 18. The IC is powered by four supply inputs. A +35 volt supply is fed to Pin 5, a -35-volt supply is fed to Pin 4, and a -22-volt supply is fed to Pin 8, 12, and 17. The supply fed to Pin 10 is normally a +22-volt supply. During signal peak drives, the voltage on Pin 10 is increased to +35-volts. Feedback sense voltage is developed across the 6.8 ohm resistors on the return side of each yoke. Transistor 7007 is part of a Soft Start circuit. When the set is turned On, Transistor 7007 turns On until capacitor 2043 is fully charged. While 7007 is being turned On, a negative voltage is placed on Pin 3 muting the output of the IC. A 220-ohm snubber resistor is across each of the yoke windings. This resistor will overheat if the unit is operated with the Convergence Yokes unplugged.

Audio

Overall Audio Block

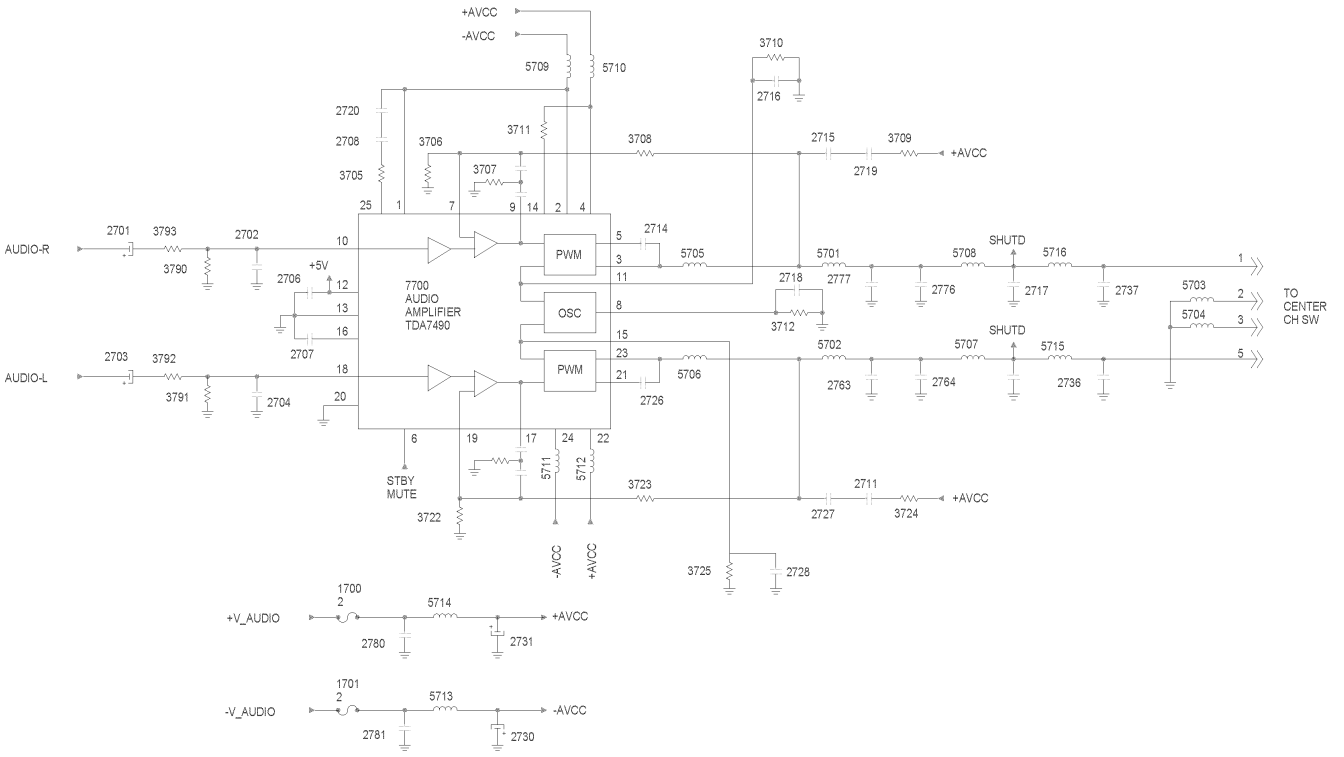


Figure 38

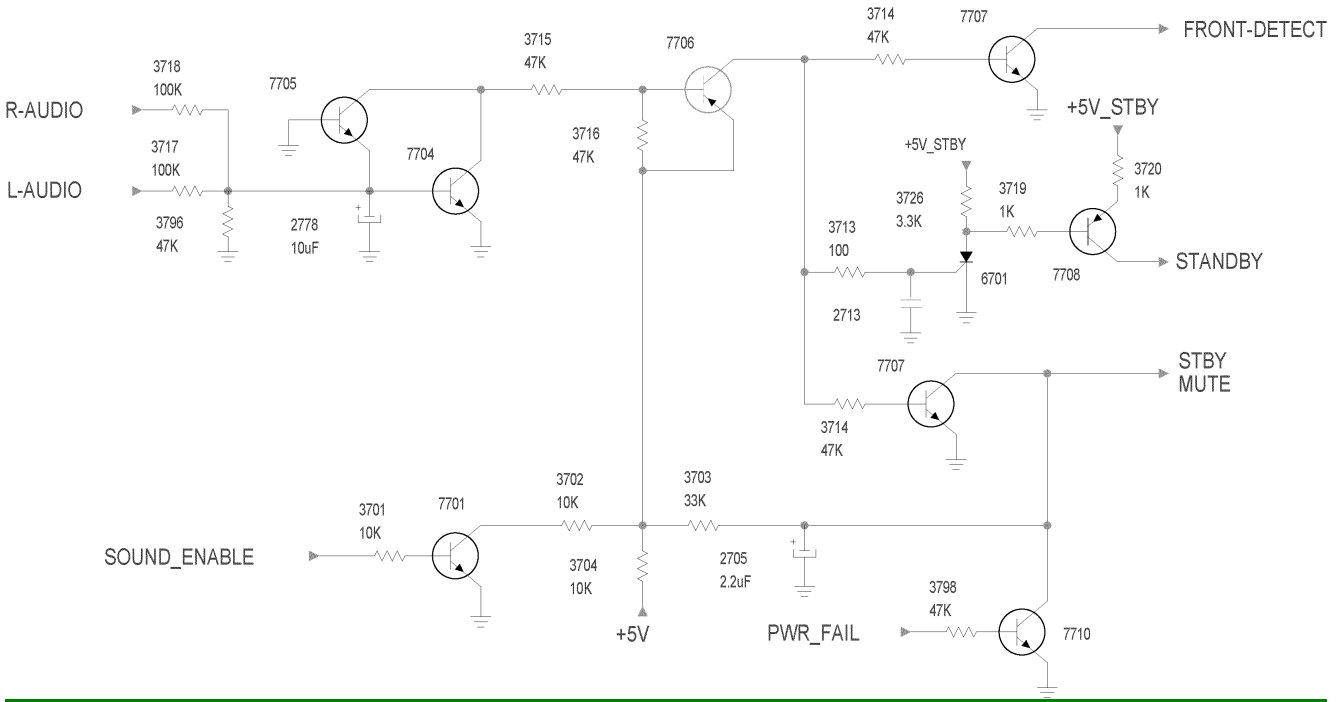
IC 7017 located on the SSM selects Left and Right channels of audio and feeds them to the Audio Processor, 7651, located on the SSB panel. The Audio processor selects between the two audio channels from the SSM or internally decoded audio from selected audio IF on the SSB. The Processor outputs line level Left and Right monitor audio and line level Sub Woofer out. These jacks are located on the SSM. It also outputs Left and Right audio to the Audio Amplifier, which is located on the SSM. Left and Right audio is output to a Headphone Amplifier located on the SSM. The output of the Headphone Amplifier is fed to the Side Jack Panel.

Audio Amplifier

Figure 39



The Audio Amplifier is located On the SSM. The output power for the Audio Amplifier is 10 watts per channel for the Basic and Basic Plus versions. The Core Version has an output of 15 watts per channel. IC 7700 is the Audio output IC. This is a class D amplifier. Left and Right Audio from the SSB is fed to Pins 10 and 18 of the IC. The output stages are basically a switch mode supply, which is driven by a 200 KHz oscillator. The Right Channel pulse width signal is output on Pin 3. The output is filtered by 5701, 2777, 2776, 2717, 5716, and 2737. The amplified audio is output on connection 1349. In the same manner, Left audio is output on Pin 23. The IC is powered by +19 and -19 volt supplies. The supplies are protected by fuses 1700 and 1701. The Supply voltage for the Core version is 4 volts higher than the Basic and Basic plus version. The extra supply voltage is needed to produce the additional 5 watts per channel output.

Muting and volume control for the audio takes place in the Audio Signal processor on the SSB. The STBY MUTE line on Pin 6 goes to 2.5 volts to mute the audio when the set is turned On or Off. This line goes Low to place the amplifier in a Standby mode if a DC voltage is detected on the Audio Output lines.

Shutdown Mute

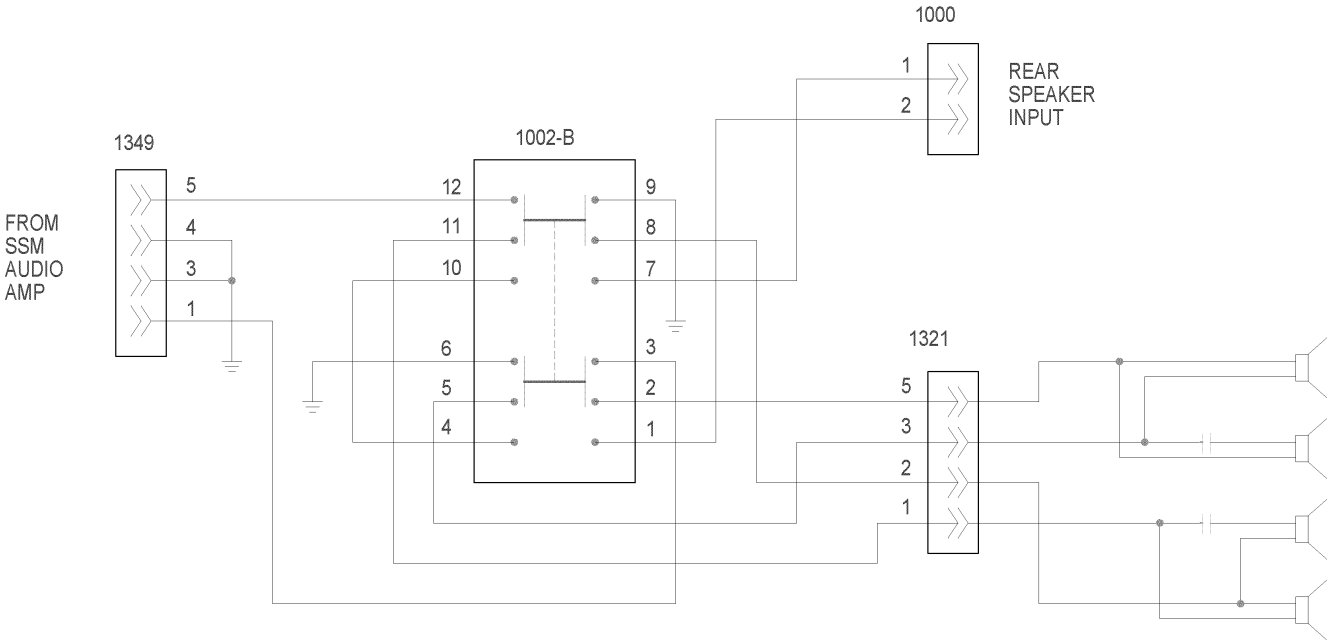


Figure 40

The Audio Amplifier will be placed in a Standby mode and the set will shut down if a DC voltage is detected on the Speaker Output lines. The Left and Right audio output lines are connected to the base of 7704 and the emitter of 7705 via resistors 3718 and 3717. Filter capacitor 2778 filters out the AC component of the waveform. If the DC voltage goes positive, 7704 will turn On. If the voltage goes negative, 7705 will turn On. This turns 7706 On. It also turns SCR 6701 On, turning transistor 7708 On, causing the Standby line to go High. If this SCR is turned On, it will be necessary to remove power from the set to reset the circuit. This will turn the set Off. Transistor 7707 also turns On, causing the Standby-Mute line to go Low. This places the Audio Output IC in a Standby mode. If the Power Fail line should go High, 7710 will turn On, causing the Standby-Mute line to go Low.

Center Channel Amp Switch

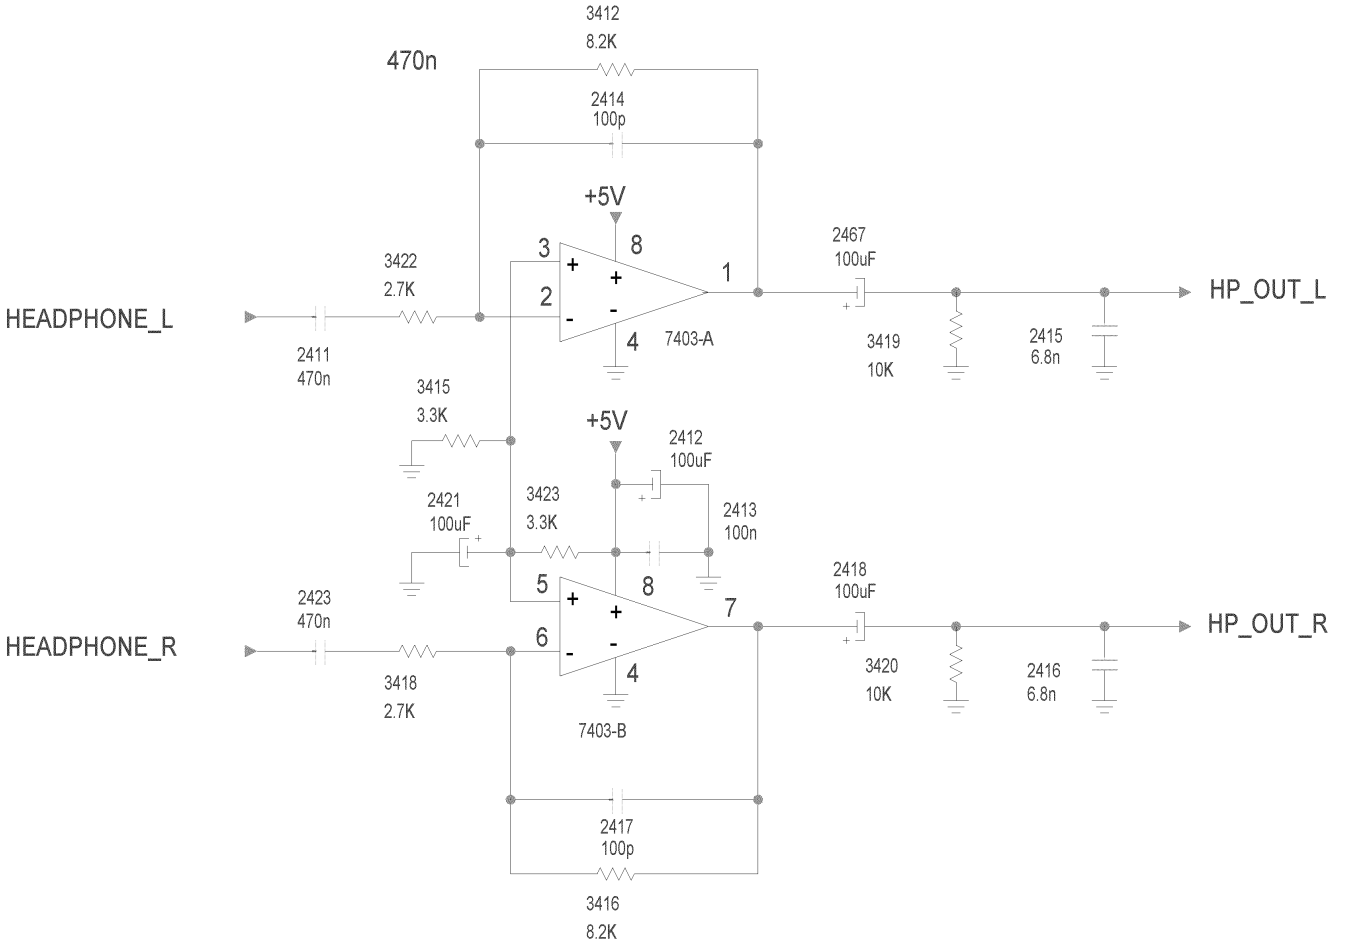

Figure 41

The Core versions have a Center Channel amp switch located on the rear of the set. The Output of the Audio Amplifier on the Basic and Basic Plus versions is fed directly to the speakers. In the Core sets, the Output is fed to the Center Channel amp switch before being fed to the speakers. When the Center Channel amp switch is placed in the External position, the Left and Right speakers in the set are placed in series with the external speaker input. In cases where the Customer has a separate sound system, this switch allows the speakers in the set to be used as the center output.

Headphone Amplifier

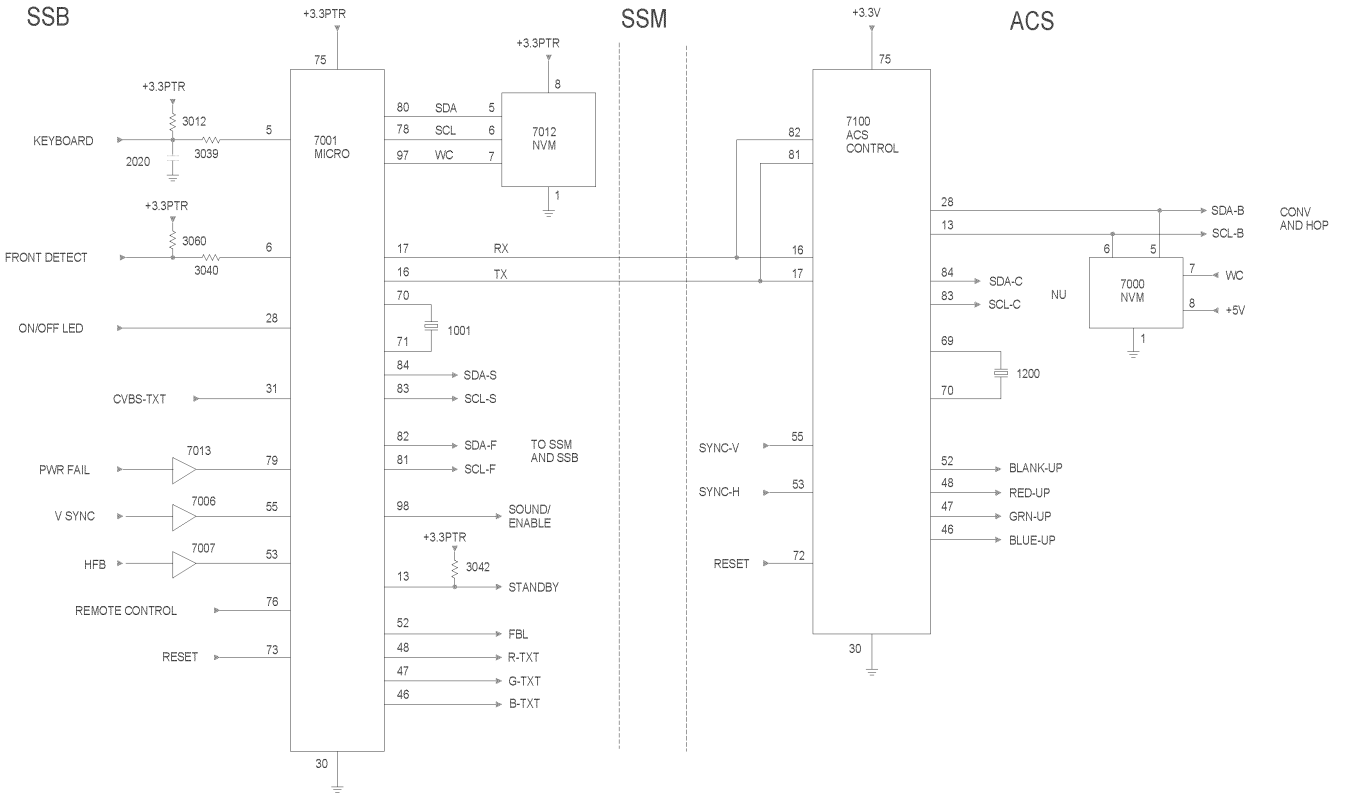

Figure 42

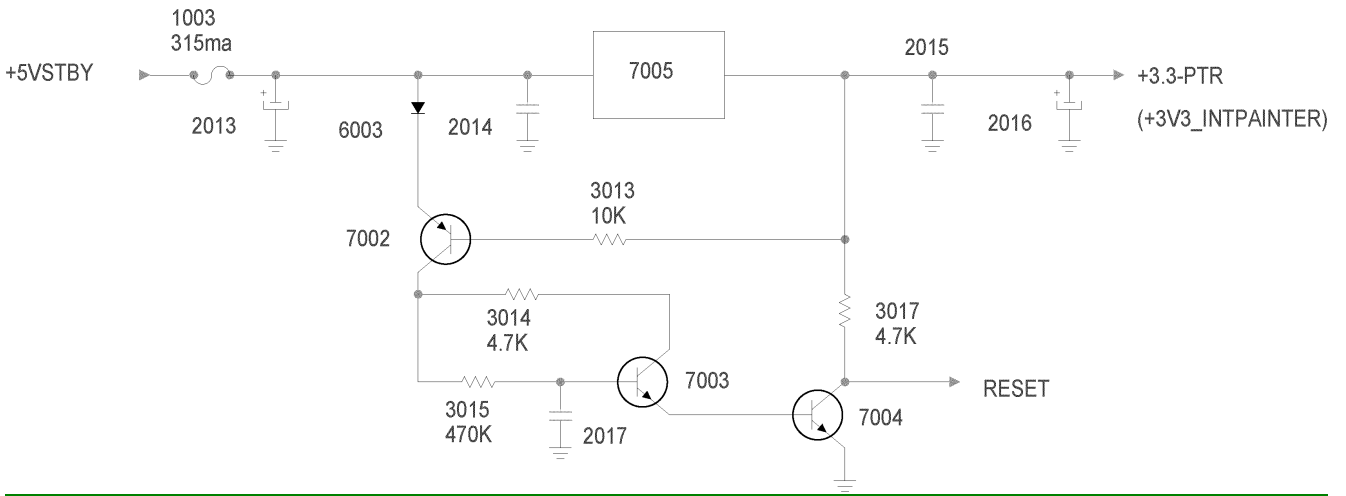
IC 7403 is the Amplifier for the Headphone output. The volume control for the Headphone output is on the Audio Signal processor located on the SSB. The Headphone Amplifier is located on the SSM. The output of the amplifier on Pins 1 and 7 is sent to the Headphone Jack located on the Side Jack panel.

Microprocessor

Figure 43

The HDR2002 has two microprocessors. The Microprocessor, 7001, on the SSB monitors the Keyboard and the Remote sensor during standby. This IC controls the Tuner, Video switching on the SSB, generates the consumer OSD.



Pin 5 of 7001 monitors the Keyboard for a voltage change to generate a command. The Front Detect line on Pin 6 monitors the AV inputs on the Side Jack panel. If a problem develops, the Front Detect will go Low, preventing 7001 from receiving any commands. The Power Fail input on Pin 79 goes High if the set looses power while the set is On. Composite Video is fed to Pin 31 for Closed Caption decoding. Horizontal and Vertical sync on Pins 53 and 55 synchronize the OSD and Closed Captions display signals, which are output on Pins 46, 47, and 48. Fast Blanking for the OSD is output on Pin 52.

There are three I2C busses on 7001. The Bus on Pins 78, 80, and 97 communicates with the Memory IC 7012. This IC stores Customer setup information, Option codes, and Error codes. I2C busses, S and F communicate with the Tuner on the PIP panel, and the ICs on the SSB. The S bus also controls the Tuner on the SSM and the Audio and Video switching on the SSM. Data lines on Pins 16 and 17 communicate with the Microprocessor on the ACS module.

IC 7100 controls the ACS module and the HOP module. The OSD output of 7100 displays the Convergence Service mode. Sync on Pins 53 and 55 synchronize the OSD. The A bus communicates with the Microprocessor on the SSB, the B bus communicates with the Memory IC,7000, and the Convergence processor. The C bus communicates with the HOP module via the SSM.

7001 SSB Power Supply and Reset

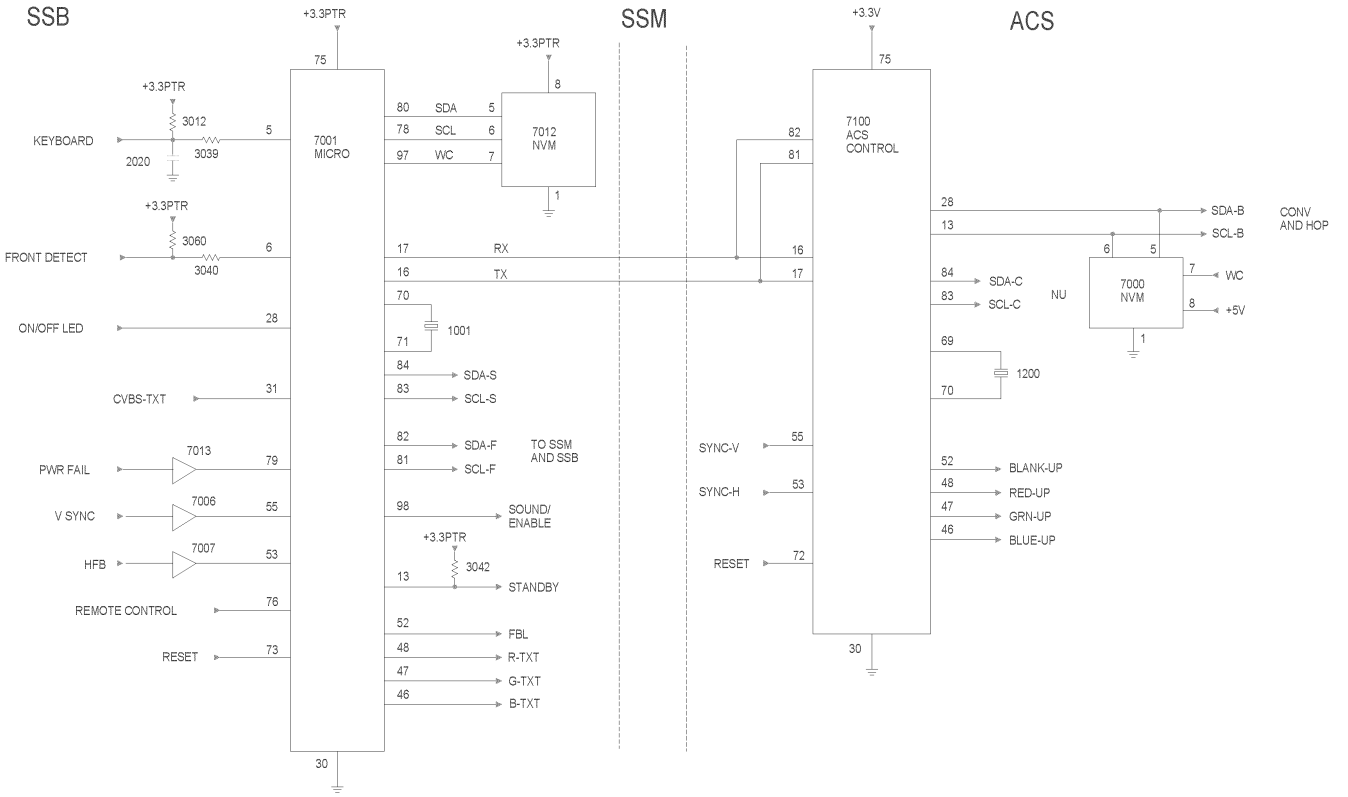


Figure 44

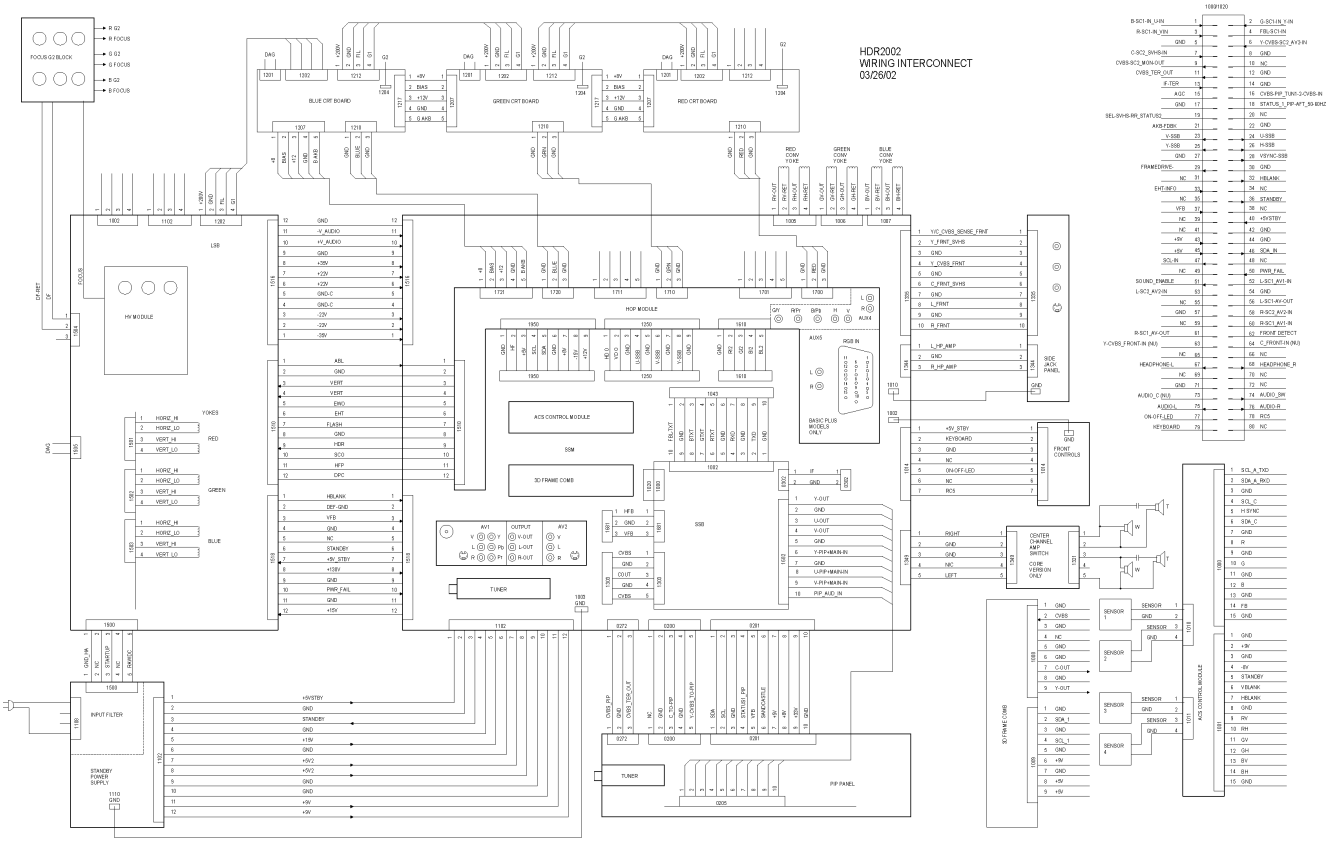
The Microprocessor on the SSB is powered by a 3.3 volt supply. The 5 volt standby supply feeds the 3.3 volt regulator IC 7005. This circuit is protected by fuse 1003. When the set is turned On, Transistor 7002 turns On. Transistor 7003 is delayed from turning On until Capacitor 2017 is charged. This delay allows 7004 to stay turned Off long enough for the Reset line to High via resistor 3017. When 2017 is charged, 7003 turns On, turning 7004 On. The Reset line then goes Low and stays Low.

On-Screen Display

Figure 45

Signal for the OSD (On-Screen Display) comes from three different sources.

IC 7001 located on the SSB (Small Signal Board) generates all the customer menus except for Convergence.



In the SAM (Service Alignment Mode), the menus are generated by 7001 except those in the GDE SAM. The GDE SAM menus are generated by IC 7100 on the ACS module.

The Convergence Alignment menus are generated by IC 7100 while the Convergence Alignment grid is generated by IC 7002.

The OSD signals from 7001 on the SSB are fed to the SSM (Small Signal Module) via connector 1002 and 1043. The OSD signals from the Convergence Processor, 7002, are buffered by 7014 through 7017 before being mixed with the signals from the ACS Microprocessor, 7100. They are fed to the SSM via connector 1000. The signals from the ACS and SSB are mixed and fed to the HOP panel and HOP IC, 7600, via connector 1610. The HOP IC, 7600, mixes the OSD signal with the video signal before feeding it to the CRTs.

Board Level Troubleshooting using the Wiring Interconnect

Figure 46

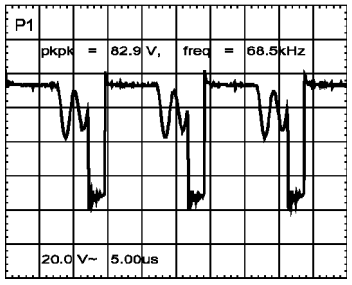
Before the set can be repaired to a component level, it is necessary to determine which board is defective. The Wiring interconnect diagram is a useful tool for this.

Dead Set

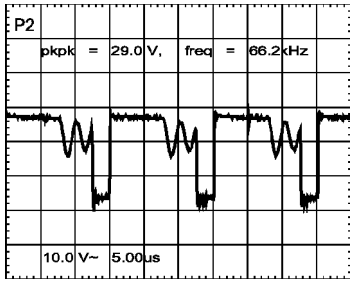
The Standby Power supply and Rectifiers are located on the Input panel. Control for power On/Off is performed by the Microprocessor located on the SSB. This Processor is powered by the 5-volt standby voltage from the Input Panel. For a Dead Set condition, check the 5-volt standby supply on Pin 1 of 1102. If this voltage is present, check the Standby line on Pin 3. This line will be approximately 2.6 volts in standby and zero volts when the set is turned On. If the Standby line goes Low, check the 130-volt source on Pin 8 of connector 1518. If this voltage is present, the Full Power supply on located on the Large Signal panel is working. If the Picture is not present but audio is, the High voltage or video drive circuits may have failed. Checking the Screen voltage from the Focus G2 block will indicate whether the High Voltage circuit is working or not. Horizontal and Vertical drive from the HOP panel must be present for the High Voltage to be present. Horizontal drive should be present on Pin 9 of 1510 and Vertical drive should be present on Pin 3.

No Picture

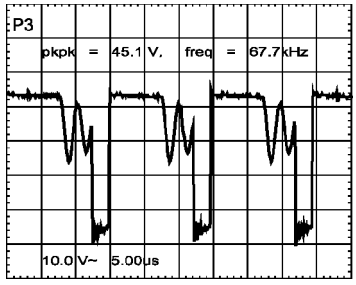
If Audio is present but there is no Picture, press the Index button on the Remote control. If OSD is present, High Voltage is working, and the CRT drive circuits are working. If the signal is NTSC, YUV from the SSM is fed to the HOP on connector 1250. YUV from the SSB can be checked on Pins 25, 24, and 23 of connector 1020.



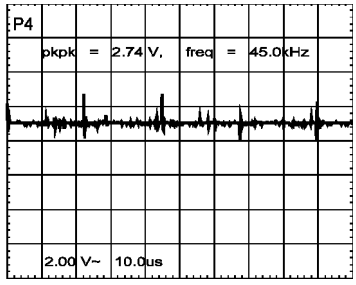
No Audio



The Audio amplifier is located on the SSM. The Audio is powered by a supply located on the Large Signal panel. This voltage can be checked on Pins 10 and 11 of connector 1516. These voltages will measure between and plus and minus 19 to 23 volts, depending on which chassis is used. Speaker output can be checked on connector 1349. A Center Channel Amp switch panel will be present on the Core models.



No Convergence Drive



The Convergence correction signals are created on the ACS module. These can be checked on Pins 9~14 on connector 1001. The Convergence outputs are located on the SSM. The +35, -35, -22 and +22 volt supplies for convergence are supplied by the LSB. The fuses for these supplies are located on the SSM.

1721	Connector, 5 Pin	2422 025 12481
1950	Connector, 9 Pin	2422 025 16046
2111	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2150	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2160	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2170	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2190	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2191	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2210	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2216	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2220	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2230	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2247	Cap, 1u, +80/-20%, 16V, Ceramic. . .	3198 017 21050
2248	Cap, 470p, 5%, 50V, Ceramic.	3198 016 04710
2250	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2260	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2270	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2290	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2291	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2321	Cap, 470p, 5%, 50V, Ceramic.	3198 016 04710
2322	Cap, 470p, 5%, 50V, Ceramic.	3198 016 04710
2324	Cap, 470p, 5%, 50V, Ceramic.	3198 016 04710
2325	Cap, 470p, 5%, 50V, Ceramic.	3198 016 04710
2326	Cap, 68p, 5%, 50V, Ceramic	3198 016 06890
2329	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2330	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2331	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2409	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2410	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2416	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2419	Cap, 10p, 5%, 50V, Ceramic	3198 016 01090
2420	Cap, 4p7, 5%, 50V, Ceramic	3198 016 04780
2421	Cap, 33p, 5%, 50V, Ceramic	3198 016 03390
2422	Cap, 68p, 5%, 50V, Ceramic	3198 016 06890
2424	Cap, 3p3, 8%, 50V, Ceramic	3198 016 03380
2429	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2430	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2436	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2439	Cap, 10p, 5%, 50V, Ceramic	3198 016 01090
2440	Cap, 4p7, 5%, 50V, Ceramic	3198 016 04780
2441	Cap, 33p, 5%, 50V, Ceramic	3198 016 03390
2442	Cap, 68p, 5%, 50V, Ceramic	3198 016 06890
2444	Cap, 3p3, 8%, 50V, Ceramic	3198 016 03380
2449	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2450	Cap, 47u, 20%, 16V, Electrolytic . .	3198 030 44790
2456	Cap, 100n, +80/-20%, 25V, Ceramic. .	3198 023 21040
2459	Cap, 10p, 5%, 50V, Ceramic	3198 016 01090
2460	Cap, 4p7, 5%, 50V, Ceramic	3198 016 04780
2461	Cap, 33p, 5%, 50V, Ceramic	3198 016 03390
